limestone from Indiana, to be fabricated into steel to serve as frames for buildings in San Francisco, or New Orleans, or Boston, or as railway bridges across the Columbia, the Mississippi, the Hudson or the Nile.

The products of the mine constitute no less than 65 per cent. of the total freight traffic of the country; they are indispensable to our interstate and international commerce, and are essential to both our present and future welfare and greatness as a nation.

It is believed that the development of a system of co-operation between the State and Federal authorities such as is thus outlined will contribute to the improvement of the service by both the State and Federal Governments; will safeguard the rights of the states; will encourage greater uniformity in mining laws and regulations in the different states; will aid in the conservation of life and resources, and will be generally helpful to mining industries of the country.

### GERMAN AND AMERICAN MINING LOCOMOTIVES.

By Frank C. Perkins.

The development of the mine locomotive has been most satisfactory during the past two decades since the first electric mine haulage system was installed in the Lykens Valley colliery of the Pennsylvania Railroad. It may be stated that electric mine locomotives are now not only extensively employed for the haulage of coal on the branch headings and main entry, but are also utilized to advantage for gathering coal from the working faces of the rooms which was formerly done by mules or horses.

While the compressed air gathering locomotive has been employed in some instances, it is stated that the radius of action is restricted and the efficiency is very

FIG. 1.

low. Where steam power is used for driving the air compressors, it is stated that the effective work done by the compressed air locomotive rarely exceeds 20 per cent. of the original power developed on account of the low plant efficiency. It is held that the efficiency of an electric mine haulage system is much higher, the losses in the engine, generator and locomotive as well as the line seldom exceeding 40 per cent.

The accompanying illustration (Fig. 1) shows the construction and method of operation of the German

mining locomotive as constructed at Berlin at the Siemens Schuckertwerke.

Attention is called to the double-bow-shape collecting device which is so largely used abroad and differs so materially from the American practice as indicated in the accompanying illustrations (Figs. 2 and 3) of the Baldwin-Westinghouse electric locomotives.

The illustration (Fig. 2) shows an American electric locomotive weighing 5 tons and measuring only 7 feet 2 inches in length, 3 feet 4 inches in height and 4 feet 1

FIG. 2.

inch in width. This locomotive is in use at the Bof Eftrellas mines, and was built for operation on a track of a gauge of about 1 foot 8 inches. The drivers are 20 inches in diameter, and the wheel base measures only 2 feet 3 inches. One only is employed on this mine locomotive, which is supplied with a direct current from an overhead trolley, the pressure being 220 volts. The mining locomotive noted in Fig. 3 is used on a gauge of 3 feet 9 inches by the Taylor Coal & Coke Company, and is of much heavier construction. It weighs 26,000 lbs. and measures 12½ feet in length, 4 feet 7½ inches in height and 4 feet 3¾ inches in width. This 13-ton mining locomotive has a wheel base 4 feet 8 inches long, and

FIG. 3.

driver 30 inches in diameter. There are two railway motors of the direct current type employed, operating from trolley circuits of 220 volts pressure.

As is well known, electric mine haulage is so extensively used that, except for a few instances where special conditions are encountered, no solid arguments can be presented against its use.

The latest power-saving device applied to tube mills is the direct driving of three appliances by means of helically cut gearing. This is expected to save both in first cost and power.

## OUR LONDON LETTER.

### British Coal Mining Statistics.—The Rand and its Problems.—The Copper Situation. The Work of the International Lead Convention.

(Exclusive correspondence to the "Canadian Mining Journal.")

The latest figures with regard to the United Kingdom mining industry are contained in the series of returns showing the preliminary results of the investigation made under the Census of Production Act of 1906. The mines investigated were those which come under the Coal Mines Regulation Act, and include coal, ironstone, iron pyrites, oil shale, fireclay, clay and shale, limestone and sandstone mines. The selling value of their gross output for 12 months was \$616,225,000. The net output was \$531,820,000. The total number of persons employed was 840,280, and thus the net output per person employed was just under \$650 per annum.

The total quantity of coal raised in 1907 was 265,134,000 tons, and the selling value at the pit's mouth \$597,720,000. 24% of the coal raised was exported, and another 7% was shipped for the use of steamers engaged in the foreign trade. Of the steam coal raised 36.9% was exported, and 14.7% shipped for the use of steamers.

The importance of the South African gold industry makes the Rand and its problems always an interesting topic to the English mining engineer, plant manufacturer and investor. Just now it is perceived that the big milling policy inaugurated on the Rand has clearly reduced working costs substantially. With the exception of three mines, figures are to hand showing that the number of tons milled on the Rand for the first nine months of this year amounted to 15,195,798 tons, the yield of gold being very nearly 110,000,000 dollars.

Taking the per ton figures we get the following averages: Total revenue, \$7.20 per ton; the working costs were \$4.25 per ton, leaving a working profit of \$2.95 per ton. This average working profit for the nine months is lower than the working profit for the first quarter, higher than the figure for the third quarter, and identical with the figure of the second quarter. The working costs, however, have been steadily falling when reckoned per ton milled. At the beginning of the year they were 10 cents per ton higher than the average for the nine months.

Of course there are certain critics who contend that the correct method of determining costs is not to take a unit of ore but the quantity of gold recovered—say one ounce or \$5 worth. Either of these quantities is equally good for argument, adherents of the latter holding the opinion that mining policy should tend towards extracting the maximum amount of gold in the minimum of time. From their standpoint costs are not diminishing.

In the first quarter of the year on the Rand the revenue per ton was \$7.40. It cost then \$2.92 to produce \$5 worth of gold. In the third quarter of the year it cost 4 cents more to produce \$5 worth of gold.

Engineers here seem now to have wedded themselves to the idea that every possible ounce of gold should be extracted and consequently low grade ore should be milled, and in order to achieve this object big reduction plants are essential. It is only by the adoption of such means that low grade ore can be pro-

fitably treated. By following out this policy it must necessarily happen that, measured in terms of gold recovered, the ratio of costs will rise.

Talking over one interesting mining innovation on the Rand with mining engineers here, your representative learns that after some years' discussion the separation of the battery plates from the crushing portion of the mill (that is, the stamps and mortars) is being introduced at the Roodepoort United Main Reef's new mill. There will be no tables below the stamps, the crushed mill product being elevated direct from the stamps by a tailings wheel to the tube mills and plate house.

The first company to remove the plates from the battery is the Knight Central. The company's mill started crushing at the beginning of the year. It was erected in six months, and it was not possible to build the separate plate house concurrently. Little extra expense, however, is involved, and it is not thought that the delay in changing over will be more than of a few days. The building will be a large one, 74 feet long, 70 feet wide and 31 feet high up to the eaves. It is estimated that the new scheme of a separate plate house will give about 10 per cent. extra tonnage by saving the time now occupied in dressing and scraping the plates, during which the stamps have to remain idle.

Another advantage will lie in the increased facilities given for obtaining a correct sample of the ore being crushed. This is now obtained from the front of the screens, and the personal equation enters largely. With separate plates, all the crushed product will run down a central launder, in which an automatic sampler will be placed.

The general arrangement of the plate house at the Knight Central will be such that no ore will pass over any of the plates until it has been crushed sufficiently fine to go to the cyanide plant. The present cycle of operations, which is normal, is—(1) Mill plates; (2) Separator; (3) tube mills; (4) shaking tables; (5) return to separator. Under the new scheme the crushed ore will pass from the mortar-boxes to a classifier of the ordinary conical type. The fine crushed ore will pass over the plates. These are to be stationary, as experiments conducted at other mines tend to show that there is little advantage in using shaking tables; from these the ore will pass to the cyanide works. Coarse crushed ore from the separator will now go to the tube mill. There are three of these now installed, which represents one to each forty stamps.

Increased interest is being taken in the outlook for lead, the price of which has not yet responded in any marked degree to the very hopeful outlook for trade generally. Operators in the metal had rather high hopes of the International Convention some months back, but nothing has been done to warrant these hopes yet.

Producers in Germany and Belgium particularly have so far been a source of weakness owing to conflicting interests. The efforts of the Convention to

secure control of the price by reducing the output which it regulated to little more than 20% of the world's total, have been engaged further by labour disputes in Australia.

Readers of the "Canadian Mining Journal" may know that the Convention has not fixed minimum selling prices, but hopes to regulate the price by means of production on a sliding scale. The authorities of the Convention have entered into a provisional agreement which extends up to the end of 1910, after which it will be terminated by giving six months' notice. It embraces Great Britain, Germany, Belgium and France. The output of the combined producers is to be handled exclusively by Henry R. Merton & Company of London and the Metallurgische Gesellschaft of Frankfurt-on-Main.

Furthermore, during recent months the International Conference has been a somewhat persistent seller and early in August the prompt price of lead fell for a moment as low as 61.50 per ton. It has since recovered somewhat. Some consumption has led to accumulation of stocks which, while being less than at this time last year, are much higher than those of a year earlier. It is also believed that there are unknown stocks in Australia and Spain.

Last year's output was over a million tons the largest producer being the United States, which got out more than one-third of this. About half as much came from Spain, less from Germany, and about 90,000 tons from Australia. The United States consumed all but about 30,000 tons of its output and this country came second with a consumption of 228,000 tons. A little way behind came Germany. France consumed less than half as much as we did. The present price of lead cannot be regarded as extravagant. The highest price touched for prompt cash last year was \$74.25, the lowest \$60.25.

The copper situation here shows a stronger sentiment in response to buoyancy of the American share market. A few days ago one of the frequent scares materially depressed the price of standard copper and heavy liquidations took place. The market has, as we say, recovered from the worst, but there are as yet no signs of revival in the demand from the legitimate trade whose attitude has undoubtedly been seriously prejudiced by the bad statistical outlook.

### EXCHANGES.

#### The Quarry, London, Eng., October, 1909.

This number contains an instalment of a treatise on the quarrying and preparation of stone for sale. The article in this issue is devoted to slate quarrying. The authors are Messrs. Allan Greenwell and J. V. Elsdon.

#### The Mining Journal, October 9th, 1909.—

A Department of Mines has been established at the British Home Office. According to **The Mining Journal** which has kept this subject before the public for some years, the new department is inadequate and faulty in organization. "What we look for," says our contemporary, "is a department organized more on the lines of colonial departments of mines, where, although the security of the mines is not neglected—as is evidenced by fatality rates comparing favourably with those in this country—commercial and economic considerations are

given their due place." Continuing, **The Mining Journal** alludes to the insufficient staff of inspectors, to the official neglect of mineral industries other than coal, and to the lack of commercial value in official reports.

#### The Colliery Guardian, October 8th, 1909.—

In a strong editorial the Guardian discusses the attitude of the leaders of the Miners' Federation of Great Britain. The Guardian touches upon the manner in which the officials of the union "despite their fervour of all reforms calculated to promote the safety of the mine, have . . . subordinated such reforms to the financial interest." The Guardian strenuously opposed "working-men" inspectors. The ideal qualification of the proposed "working men" inspectors is to judge from the assertions of one of their chief advocates, "not one that can be suitably tested by any examination; it is simply that the candidate shall not have had an education worthy of the position." On the other hand, "mine-owners and managers. . . desire that those who shall be in a position to dictate to them shall have the necessary technical qualifications irrespective of birth or social standing."

#### The Mining Magazine, October, 1909.

The second number of **The Mining Magazine**, is a worthy successor to the first. A great many subjects are treated. One of the most interesting articles is from the pen of Mr. T. A. Rickard, hydraulic mining is the subject. The operation of an hydraulic elevator is described. On Discovery claim, Ophir Creek, one elevator has been used to work ground since 1898. In addition to the monitor and the elevator a water-lift is employed to pump the seepage in the excavation where this work is proceeding. The installation and working of the elevator are outlined. The cost of operations in this case for 1907 was 45 cents per yard. The use of the monitor and the elevation insures the disintegration of any clay associated with the gold. Decomposed schist is cut and broken with the force of the jet. The hydraulic elevator is extravagant in its use of water. In a country where the precipitation of moisture is small, and where alluvial deposits are widely scattered, it is wasteful to employ water directly to raise water. With water worth \$1 per miner's inch per day, it is possible to use this form of natural energy to better advantage. In many cases it would be more economical to transform the energy of the water into electricity and transfer the power along a copper wire for use in machinery. This idea has already been applied in the Yukon.

The heavy stamp is an assured success, for from a trial run of the new twenty heavy stamps installed on the West Rand Consolidated the individual crushing capacity has been proved to be fifteen tons per day. They were estimated to be able to perform a duty of twelve tons, and it is satisfactory to note that the calculations of the engineers have been more than fulfilled. The importance of this development, not only to the West Rand Consolidated, but to other mines where heavy stamps are being erected, is obvious. It makes, of course, for a further reduction of working costs on the Rand. At the Roodepoort United 100 stamps of 1,910 lb. each are now being erected, and this weight may be even further increased in the case of yet another 100 stamps to be put up on the West Rand Consolidated.

### PYRITE IN THE UNITED STATES.

The production of iron pyrites in the United States in 1908 amounted to 222,598 long tons, valued at \$857,113, an average price per ton of \$3.85. In 1907 the production was 247,387 tons, valued at \$794,949, or \$3.21 per ton. In both years Virginia was the principal producer. The worked deposits in Virginia occur as large lenticular masses conforming to the foliation of the inclosing rocks, mostly crystalline schists of various types. The pyrite is either massive or granular, varying in texture from fine to moderately coarse grained. It is usually associated with varying quantities of quartz and calcite. The general mining practice is to sink shafts in the direction of the dip and to run levels from both sides of the shaft in the direction of the strike. The walls are strong and little trenching is necessary. Imported pyrite still greatly exceeds the domestic supply.

### CANADIAN PATENTS.

The following is a list of Patents issued by the Canadian Patent Office on Oct. 12. relating to Mining and Metallurgizing, and furnished by Fetherstonhaugh & Co., 5 Elgin Street, Ottawa, Russel S. Smart, Resident:

121101. A. S. Dwight, Joliet, Ill., R. L. Lloyd, New York City, processes for roasting and sintering ores.

121103. E. J. Meeker, E. Orange, N.J., F. L. Holmquist, New York City, executors of G. M. Westman,

121105. S. W. Berglund, Stockholm, Sweden, processes for the manufacture of fire-proof stone, of lime and quartz or such like.

121141. J. Hansford, Portland, Eng., mfg. of gas and coke or the like.

121144. H. K. Hess, Philadelphia, Pa., processes and app. for extracting copper from its ores or matte.

121178. C. Rollin, Newcastle-on-Tyne, Eng., mfg. of barium compounds.

121199. R. H. Vidal, Paris, France, processes for obtaining colouring matter from animal fibres.

121200. C. E. Wakefield, London, Eng., treatment of calcium carbide.

### THE RIDDLE READ.

A waiting world hangs on the words of Cook and Peary. Moving silently, but swiftly, the Canadian Mining Journal, with a fine disregard of time, space, and expense, has secured for its own exclusive use, a scientifically exact account of a remarkable dash to the North Pole. The narrative contains a genteel sufficiency of technical terms, and, on the other hand, human interest is not lacking.

The ingenious expedients whereby the larder was replenished eclipse totally the crude penumican and cruder gum-drops of Cook and Peary. The amphibious craft in which the journey was made marks an epoch in locomotion.

But most important are the geographical data observed and recorded. We are proud that it has fallen to our lot to announce the discovery that there is no latitude at the Pole—for untruthful persons.

We commend the whole narrative to the attention of all scientific bodies. It is with unbounded pleasure that we rise to remark that it requires a mining man to do the thing properly.

Our traveller's diaries and official records were sealed in a German silver tube, (a converted sugar-sprinkler), attached to a stone, and ejected from the submerged craft in the water that surrounds the foot of the Pole. There they lie.

### A QUESTION OF LATITUDE.

By A. M. Hay, Toronto.

(All rights and wrongs reserved.)

All successful navigators, have been prevaricators

Since the days of good old Noah and the Ark;  
Columbus told some tales, of sea serpents, whales and gales;

And Raleigh, with the public, had a lark.  
While they sailed the summer seas, navigating at their ease,

With their topsails and their spinnakers unfurled,  
They'd no trouble to keep warm, lots of time to spin the yarn

Which, later on, they reeled off to the world.

The circumnavigator, sticking close to the equator

Made slow progress, by degrees of longitude;  
And, while sailing east or west, he always found it best  
To borrow just a little latitude;

He created quite a rumpus, every time he boxed the compass,

But he ultimately got his work down fine;  
When the compass he could box, he had solved the paradox

That a semi-circle's shorter than a line.

But Arctic navigation evolved a new equation

Full of difficulties no one understood,  
And only those might try, who never told a lie,  
And whose characters from childhood had been good

I longed to be a hero, at eighty below zero,  
To leave the world behind me, and its vice;

Capture walruses and whales, face the howling Arctic gales;

Camp in Igloos, made of virgin snow and ice.

So I chartered for the trip, a combination ship,

One requiring special skill to navigate her;  
She could sail or fly with ease, climb mountains and scale trees—

By lumber-Jacks she's called an alligator.  
I fitted out my craft, rechristened her the Taft,

Then looked about to find a truthful crew;  
Had the luck to find a Bos'n, born and bred upon the ocean,

And a treasure of a Sea Cook, making two.

Though the Bos'n couldn't lie; had but one leg and one eye,

He could damn and curse and swear like a bargee;  
He could furl and reef and steer, and no better Engineer

Or Fireman, e'er was found on land or sea.  
The balance of the crew, could boil and broil and stew,  
And make skilly, out of icebergs at a pinch.

With such a boat and crew, the end I had in view  
Seemed a simple undertaking--was a cinch.

When at last we struck the trail, weighed our anchor  
and set sail

Not a soul was there to cheer as we departed,  
Which perhaps was just as well, there'd be nothing left to tell

Had I told them all my plans before we started.

I've been brought up from my youth, to always tell the truth,  
And to swear all affidavits on a book ;  
So in sunshine and in fog, I entered up the log,  
And had it witnessed by the Bos'n and the Cook.

Our ship had lots of power, good for sixty miles an hour  
Though we started out at seven, in a fog.  
She burned icicles for coal, and as we neared the pole  
She ran up to a hundred, by the log.  
The nearer we got there, the hotter got the air,  
Caused by friction of the alligator's flight ;  
But what could you expect, when you pause to recollect,  
That the blazing sun stayed up with us all night.

On a Friday, just at noon, by the pale light of the moon  
The Bos'n piped his dead eye, and reported  
That the son of a Sea Cook had quietly took his hook  
And that all supplies on board had been deported.  
The news gave me a shock, worse than striking on a rock ;  
The fond hope which until then I had cherished,  
The ambition of my soul, to be first to reach the Pole  
Was in peril of forever being perished.

When I got the information, I made an observation,  
While the Bos'n made a number of his own—  
On the last part of the trip, I would try an Arctic dip  
And travel underneath the iceberg zone.  
So we opened the sea-cock, sank, like going down the lock,  
Went full speed ahead, and then I held my breath,  
For if we slipped a cog, or struck a sunken log,  
It was clearly, just a case of instant death.

I made a calculation, that a little variation  
South of north, would cut the distance just in two  
'Twould be easy to emerge, where lines of longitude converge  
If we steered north—astronomically true.  
We knew we'd reached our goal when we bumped  
against the pole  
Took a half hitch—then we emptied out the tanks.  
As we bobbed up from below, we could hear the breezes blow,  
And on our knees, we offered up our thanks.

On dewatering my eyes, lo ! What was my surprise  
To find the Pole was spinning like a Peary ;  
And there was Cook on top—no I never drink a drop ;  
But I must admit the Bos'n's eye is bleary.  
There are no prevaricators, amongst Arctic navigators ;  
I couldn't tell a lie to save my soul ;  
And I've solved the new equation of Arctic navigation :  
There's no latitude, for liars, at the Pole.

Mr. Boyd Magee, general manager of the Keeley mine, South Lorrain, is in Toronto.

Mr. R. B. Lamb, of the C. L. Constant Company is leaving on a prolonged tour of the Western Mining sections.

Mr. W. H. Trewartha-James, general manager of the Tyee Copper Company, leaves Vancouver shortly to visit London on business. He will return about the first of the New Year.

Captain W. H. Jeffery has resigned his position with the Silver Cliff Mining Company and has left for British Columbia. As manager of Chambers-Ferland, and in his last billet, Captain Jeffery did good work.

The British Broken Hill Proprietary Co., Ltd., has increased its contract for Elmore Vacuum Machines from five units to ten units, the whole plant should thus have a capacity of 400 to 500 tons of zinc tailings per day.

The Way's Pocket Smelter Co., of South Pasadena, Cal., announce that their exhibit has received the highest award in the Mining Building at the Alaska-Yukon-Pacific Exposition in Seattle. This gives Way's Process the highest award of any method of ore testing, as well as showing that it was the best and most attractive exhibit.

October 27, 1909, was an eventful day in the history of the Canadian Mining Institute, for on that day the billiard championship of the Institute was decided. Mr. Eugene Coste and Col. A. M. Hay were the contestants. Preliminaries were arranged by Dr. W. G. Miller. Col. Hay won a brilliant victory. The end is not yet.

A complimentary banquet was tendered to Mr. J. Stevenson Brown, until recently the treasurer of the Canadian Mining Institute, at Montreal, on the evening of Friday, October 22. Major R. G. Leekie occupied the chair, supported by Mr. Charles Fergie. Each mining province, with the exception of Alberta, of the Dominion was represented. Mr. Fergie spoke for Nova Scotia; Major Leekie and Col. A. M. Hay, for Ontario; Mr. H. Mortimer-Lamb for British Columbia; and Mr. John J. Penhale, for Quebec. There were present also Mr. E. E. Ling, of New York, representing the United States members of the Institute, President W. G. Miller, and Councillors R. T. Hopper and H. A. Drury. During the evening a beautiful silver service was presented to Mr. Brown.

The new smokeless fuel of Sherard Cowper-Coles is made by mixing one part by weight of wet peat with two parts of bituminous coal, and heating in a retort five hours at about 850 degrees F. The temperature, aided by the steam from the peat, is just sufficient to drive off the hydro-carbons that produce smoke. The coal binds the peat into a coherent mass, and this fuel has high calorific value, igniting readily in an ordinary grate, and burning economically and without smoke. The tar and other products distilled over in the watery extract may be condensed into a superior pitch, while the gases may be burned to supply the heat required by the process.

#### PERSONAL AND GENERAL.

Mr. Charles Fergie is ill in Montreal.

Mr. J. E. McEvoy is making Toronto his headquarters for the winter.

Mr. C. L. Constant, Jr., of the C. L. Constant Company, is making an extended professional visit to the mining sections of Ontario and Eastern Canada.

## SPECIAL CORRESPONDENCE

## NOVA SCOTIA.

**Glace Bay.—The U.M.W.A. Strike, 19th October, 1909.**—The trend of events in connection with this strike is best shown by figures, and we therefore make no apology for repeating those given in the last letter, with the addition of the average daily outputs for the first half of October.

| Month                | Total Output. | Average<br>Daily Output. |
|----------------------|---------------|--------------------------|
| July .....           | 136,000       | 4,200                    |
| August .....         | 154,000       | 5,900                    |
| September .....      | 180,000       | 7,200                    |
| October, 1-15, ..... | 102,000       | 8,000                    |

We estimated the number of men still out on strike at the end of the third month of the trouble at 1,700 men, and this estimate was confirmed by a parade of U.M.W.A. adherents which was held on the 15th October. This parade was composed of approximately 1,650 persons, and as the men marched in extended order two abreast the procession was of imposing length.

There were several noticeable things about this parade: One was the small stature of the men who marched. The large majority of the processionists possessed the typical physique of the European miner, the characteristics of which are a certain "stockiness" and a marked development of the shoulders and torso in comparison with the lower limbs, and a gait which resembles that of the sailor. This type of physique has been transmitted from generations of miners who have worked in the low seams of Europe, and is not typical of the native Cape Breton miner. The last-named has not more than two or three generations of coal miners behind him, and neither he nor his forbears have ever worked in seams which do not permit of the miner standing upright. There was a sprinkling of the unmistakable Highland strain in the procession, but it was lost in the general impression one obtained of the strikers. One noticed the broad faces of the Huns and Poles, the bristling moustaches of the Belgians, and the dark complexions of the Italians, but as a representative gathering of Nova Scotian miners the parade was a dismal exposure of the true nature of this lamentable strike. We noticed also a number of small boys, several bar-tenders, and men whose working days had long since passed. There is no doubt the procession represented the full strength of the men on the relief roll of the U.M.W.A. at the mines of the Dominion Coal Company. There is a printer just across the way from the office of the Coal Company who believes that Socialism will bring the millenium. This enthusiast, as the head of the procession passed his door, tacked up a red poster, reading: "Vote for Socialism, the only remedy," and took in the poster as the last man went by. It is to be feared the advice was lost on many of those who walked by, not because the advice was un congenial, but because they could not read the English.

The foregoing is not written in any spirit of disparagement other nationalities, but simply to point out that this strike is not centred in Cape Breton and has not arisen out of any local discontent. It is a purely artificial disturbance, brought about by the lavish expenditure of the funds of an American union, and by intimidation of the non-native population, aided by politicians fishing for votes and a small group of disappointed office-seekers who preferred to accept the dole of a foreign union rather than bend their energies to the building up of their own organization. If those who have read in Toronto and Montreal newspapers the statement that "four thousand of the best miners in Nova Scotia" were on strike at Glace Bay, could have viewed this procession, it is to be feared the impression they would carry away would have been unfair to the Nova Scotian miner as he is in reality.

The U.M.W.A. in its abounding wisdom has brought suit against the Dominion Coal Company because, among other enormities, it has "unduly limited the facilities for mining coal." When the Coal Company was incorporated in 1893 the output was 800,000 tons per annum. For the past three years the output has been a little over three and a half million tons annually. The Dominion Coal Company, in the sixteen years of its existence, has added an annual production of coal to the total Canadian output of 2,700,000 tons, or 25 per cent. of the whole production of this Dominion. Notwithstanding the accusations of the U.M.W.A., the Company is proceeding with its policy of limitation, and has three new collieries under construction. The work at Dominion Nos. 12, 14, 15 and 16 Collieries on the Lingan-Victoria areas has been somewhat hindered by the intimidatory tactics of the U.M.W.A., which has endeavoured to prevent the construction men from going to work, and the Company has had to put up with such pleasantries as incendiary fires in the woods around the new mines. Nevertheless, good progress is being made. No. 12 Colliery is complete and ready for producing good outputs. At No. 14 Colliery the permanent bankhead and buildings are well advanced. At No. 15 the work would have been much further ahead but for the violence of the strikers, and it has been found necessary practically to stop operations there and at No. 16 Colliery.

Good progress is being made with the electric transmission line from Dominion No. 2 Colliery to the Lingan collieries. The poles are all erected and braced, and a portion of the wire is strung. The excavations are progressing for the condensing plant at No. 2, and the makers are working on the exhaust-steam turbine, which is to generate the power for the Lingan collieries.

At No. 2 Colliery the addition to the bankhead to house the new screening plant is completed. This screening arrangement will be similar in character to those at the Reserve and No. 6 collieries, and will consist of shaking screens and picking belts.

The activities and doings of the Stock Exchange are far removed from the actual operations of industrial concerns, and the rumours of a merger of steel and coal do not convey much immediate meaning to those who are engaged in the actualities of producing coal and the strike situation. Many of the shareholders in Dominion Coal do not fully realize what a magnificent property that company controls. Its areas are for all practical purposes inexhaustible, and cover the only coalfield in the whole Atlantic seaboard of this continent. The property in course of time will appreciate to an extent hitherto undreamt of. There are few properties in the world with such potentialities as that controlled by the Dominion Coal Company, and it will have to be an exceedingly good deal that gives the shareholders of this company what their property is worth.

## ONTARIO.

**Kenora Mining Division.**—This district comes to the front again with the report of a valuable copper strike within 20 miles of Kenora.

Dr. S. S. Scovil and Frank Moore, the latter an old prospector who was employed in the original opening of the Calumet and Hecla, of Michigan, are now working this claim, which is situated on Alley Island, near Oliver Point, on the Lake of the Woods, within twenty miles of Kenora.

The samples brought to town and shown round contain native copper throughout, and the vein matter seems to be very soft and shale-like in its cleavage. In fact so soft is this vein matter that one would almost be inclined to say it was decomposed

from weathering were it not for the fact that no harder rock is visible even at the tunnel end.

The vein is stripped for 700 feet, and shows a width in one place of 120 feet.

The report of a recent trip through the West Hawk Lake and Star Lake districts gives a good idea both of the main features of the country and its inaccessibility. It says in part:—

“Leaving Ingolf station we paddle to the western outlet of Long Pure Lake, a distance of one mile, then portage to West Hawk Lake across a good dry portage of three-quarters of a mile and paddling down the east side of this lake we come to a point of contact between the granite and the older formations, along which contact is a heavily-mineralized vein on which are located the Mineral Queen and Mineral King mining claims, the latter being owned by Anthony Blume.

“This contact is clearly defined for a distance of eight miles from the lake shore, running S.E. by E., and is again visible on the west side but it changes its direction and swings to the south in a semi-circle, passing within a mile of the Manitoba Shiner on Little High Lake.

“On the western shore of the lake we come to the Bayfield and Caledonia, which show perhaps the most interesting geological formation of any location on the lake.

“On the Bayfield is a bluff 30 feet high, running out into the lake, showing on its exposed face copper and iron pyrites and tourmaline, while the crevices show a curious greyish encrustation not unlike the famous cobalt bloom. Traversing the remainder of the lake to the western extremity, we make a short portage into Star Lake, where the formation changes, showing frequently heavy quartz veins, many of which have been staked and are yielding good gold values.”

**Cobalt.**—Considerable uneasiness was recently felt by many of the mines owing to a coal famine, which seriously threatened them with a shut down. This shortage is due to various causes. The accommodation for freight at the Cobalt railway yards is limited, and the increasing volume of business in the district has brought about a congestion of freight, and the difficulty in securing teams to haul away the freight and coal as soon as placed seems to add to the trouble. Moreover, many of the mines have allowed their coal reserves to become depleted in anticipation of the delivery of the air and electricity before this time. The first mine to benefit by the electric power is the Colonial, where the mill was started up a few days ago. From here the transmission line is being extended to the King Edward, where everything has been in readiness for some time. The present power is being furnished by a temporary generator until such time as the main plant is completed. The importance of the new power to this district cannot be too highly estimated, since the reduction in the cost of power is in itself a considerable item, which will enable many properties now closed down to resume operations. This power will also aid materially in the opening up of the new properties in the Gillies Limit, where such promising finds have been made. The average cost per horse power per year is estimated at about \$175, whereas the new power will be sold for \$50 per horse power per year. The Cobalt Hydraulic Power Co. is pushing its work as rapidly as possible, and expect to have the air ready for distribution by the middle of December. They already have about nine miles of the twenty inch, and five miles of the twelve inch mains connected up. The Mines Power Co. has a force of some thousand men at work, and is making excellent progress. Its two 5,000 ft. compressors will be shipped from England within the next two weeks.

In this connection it might be mentioned that a new and important undertaking of interest to the Cobalt district has recently been financed by Toronto capitalists. This is the erection of a sampler plant, the site for which has been secured from the La

Rose Mines, on the west side of the T. & N.O. tracks, from which a short spur will be constructed. The question of a sampler for Cobalt has long been discussed, and overtures were made to the Ontario government to subsidize this undertaking, but met with no success. The present enterprise is being undertaken by Messrs. Campbell & Deyell, a local firm of engineers entirely on their own responsibility. The capacity of the plant will be one thirty ton car of high grade ore a day. The ore will be ground in a ball mill, and four separate samples taken by automatic riffle samplers, each of these samples being automatically sampled down. A separate plant will also be erected for the sampling of low grade ores, and storage bins of sufficient capacity erected to contain the ore, should it be found necessary to make additions to the ore in order to make same acceptable to the smelter to which it is consigned. This sampler will be of great benefit to many mines, several of which have stated their intention to have their ore sampled. At the present time, with but few exceptions, the only manner in which the silver contents of a shipment are ascertained is by a grab sample, which naturally is anything but accurate. With the facilities for proper sampling, mines desiring to ship low grade ore will be enabled to first determine whether same is of sufficient value to make the shipment a paying one. It is well-known that shipments have left this camp that have not paid for the freight and treatment charges.

Both the mines now using the cyanide process find that the consumption of cyanide amounts to much less than was estimated. Both the O'Brien and the Buffalo are satisfied at the success obtained with this process, which is practically new in this camp. The cyanide consumption at the O'Brien amounts to about 46c. to the ton, while the tailings assay run about 40c. to the ton. This company has decided to eliminate straight concentrating, and cyanide straight from the stamps. Taking into consideration the very complex nature of the cobalt ores it is doubtful if this process can be applied successfully, but the probability is that before long many of the concentrators will be equipped with cyanide plants to treat the slimes.

The district of South Lorrain still continues to attract considerable attention. An important discovery has been made on the property known as R. L. 470, lying about one-third of a mile north of the Kelley, and consists of the same formation as the latter, keewatin and diabase. The vein is in the keewatin formation and has been trenced for about three hundred feet, and in places shows good values in native silver. The Wetlauffer, one of the best known properties in South Lorrain, has 3 in. to 4 in. of high grade ore in the bottom of its shaft at a depth of 110 feet, with the wall rock well mineralized for some distance each side of the vein. It has already shipped one car of high grade ore, and the Keeley has also shipped two cars of medium. Work has been steadily progressing on both these properties all summer, and has proved up a large area. Mining activity in this section will be greatly facilitated in the future as soon as the electric power from the Mines Power Co. is available. The main transmission line of this company, whose plant is at Matabichouan River, which empties into Lake Temiskaming just south of the Montreal River, passes right through this district. Although this district is not as yet served by any direct railway communication, it is an easy matter to team the ore to the shores of Lake Temiskaming and there load on scows and tranship to the C.P.R. at Temiskaming station, at the foot of the lake. The low rates by water offset to some extent the additional expense incurred by re-handling the ore from the boats to the railway.

A large number of claims have been taken up this summer around Fabre, on Lake Temiskaming, in the province of Quebec, just below South Lorrain. This district has been opened up to the prospector owing to the recent changes in the mining laws of Quebec. The size of the claims is 100 acres, and measures one mile long and one sixteenth of a mile wide. One dollar a

acre has to be paid when the claim is staked, and four months are allowed in which to do the work.

The slump in the La Rose and Nipissing stocks, more particularly the La Rose, caused considerable comment in the Cobalt district, since there was no apparent reason for such a sudden drop. One explanation is that Guggenheims are responsible, and that they beat the stock down in an endeavour to get at the lower figure. The most likely explanation is that it is due to market manipulation by some New York interests for the purpose of driving out weekly-held margin accounts. Hitherto La Rose and Nipissing have been very free from market attacks, except in a slight degree.

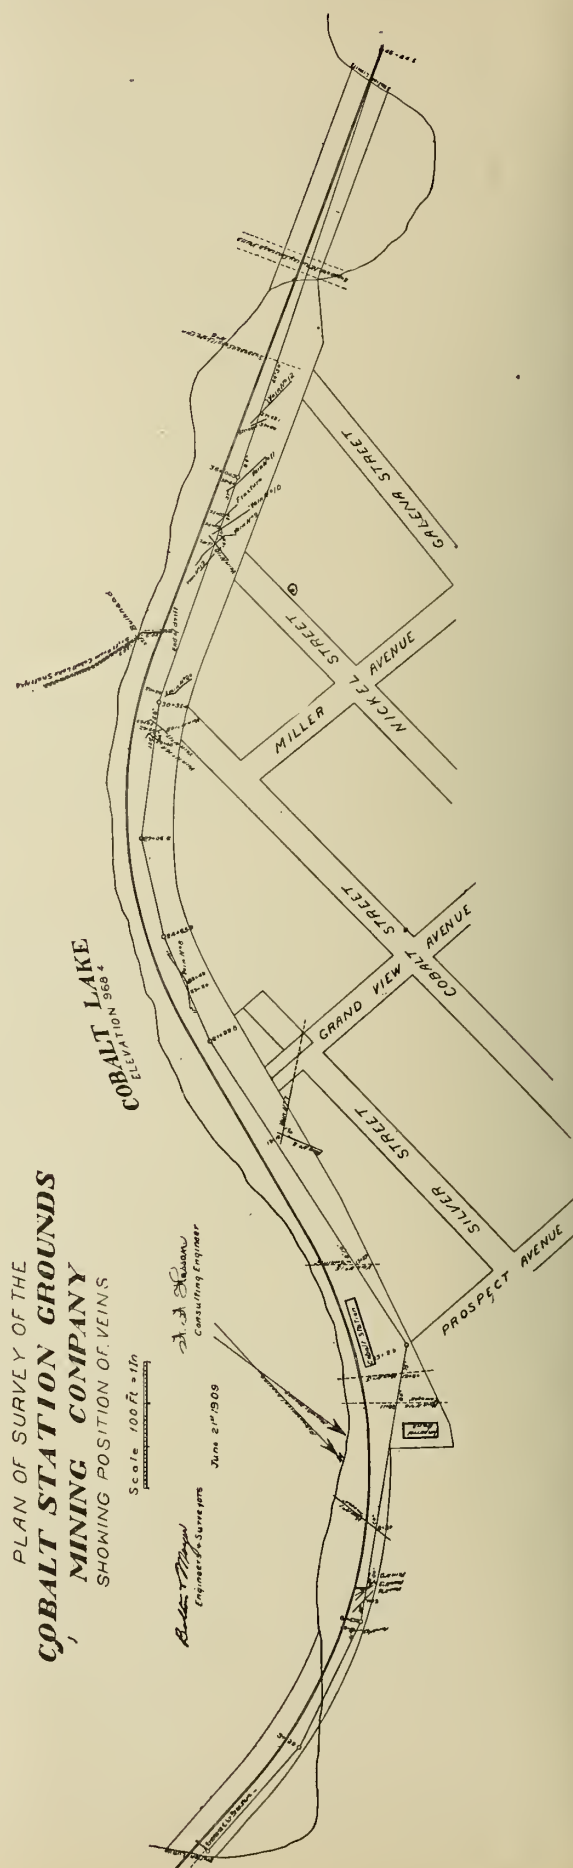

The Crown Reserve Mining Company has leased the Silver Leaf for a period of five years, on a royalty basis of twenty-five per cent. of the gross output of the mine. According to the terms of this lease Crown Reserve must spend twenty thousand dollars in development work on the property during the first year and ten thousand dollars a year for the four succeeding years. A short time ago a shoot of high grade ore was encountered in one of the old workings of the Silver Leaf. A statement has been made by the Crown Reserve that the rumours regarding the draining of Kerr Lake are entirely without foundation, and that this proposition has not been considered. This however, is incorrect, as some time ago the matter was gone into, and a tunnel was proposed, which would drain into Cross Lake.

Members of Parliament from England, Mr. J. A. Baker and Mr. T. Davis, accompanied by Mr. Dignum, visited the camp, and looked over one or two of the properties, prior to making a trip to Gowganda, where they will look over the Reeves-Dobie property, in which they are interested. It is generally understood that the Reeves-Dobie and Blackburn properties each has sufficient ore sacked to make a shipment as soon as satisfactory arrangements can be made for its transportation. The Reeves-Dobie has already made a contract with the Gowganda Transportation Co. to take out their ore at the rate of \$15.00 per ton. It is probable, however, that shipments will not be made until the winter roads are in good shape. Freight rates this season to and from Gowganda should be considerably lower than last year, considering the new and improved roads, and there is every likelihood of increased activity in that section. The Bartlett Mines, of which so much was heard last winter, have sunk to a depth of 100 feet on their main vein, and from that point a crosscut was driven to catch the vein which dipped from the shaft, but failed to find it, and it is believed that the vein pinched out before attaining that depth. Good ore has been opened up on a smaller vein in the No. 2 shaft at the 75-ft. level.

In the Gillies Limit a half interest in the claim known as A.11, which adjoins the Waldman and Young-O'Brien and Silver Bar properties, was purchased by Montreal capitalists. The value of this lot lies in its proximity to the Waldman and Young-O'Brien, on which such good discoveries have recently been made. A gang of men will be put to work at an early date to thoroughly prospect the property by trenching and stripping. The claim has an area of nine acres.

The Union Pacific Mining Co., operating on Peterson Lake, has secured control of the Michigan property adjoining the Farah and Silver Leaf. The price paid is \$240,000, \$140,000 of which is to be paid at once, and the balance within a period of five years. But little work has been done on the Michigan. A shaft has been sunk to a depth of 120 feet, and from this some drifting has also been done.

New gold discoveries are reported from the townships of Whitney and Tisdale, to the north of Gowganda, near Porcupine Lake. Some five hundred prospectors are reported to be on the ground, and many more are going in. All the available ground in Whitney and Tisdale has already been staked up, and pro-

spectors are moving south to the Temagami Forest Reserve. It is announced that the Government will send in an engineer to report on the district. The quartz veins are said to be very rich in places, and generally strike north-east and south-west. The veins are narrow and very similar to those in the Painkiller Lake district, where considerable work has already been done, and the results obtained so far have been very satisfactory. It is said that one claim in the new district has already changed hands for the sum of ten thousand dollars.

The Haileybury Silver Mining Co. has declared a 50 per cent. dividend from the funds obtained from the sale of one of their properties in South Lorrain.

The T. & H. B. has declared another 300 per cent. dividend.

The name of the Young-O'Brien Company has been changed to Wyandoh. It is reported that a fourteen-inch lead of calcite was opened up on A.15, one of the properties of this company, in the Gillies Limit.

In the Le Roi Lake district the Harman-McDougall & Ross syndicate is said to have encountered a new vein, showing high values in silver in places. The vein has been stripped for about 200 feet.

Although the syndicate which purchased the Provincial Mine has only been operating the plant about a week, good results have already been obtained. A good vein has been discovered on the 125-ft. level, and another surface vein has been located near the north end of the property. This syndicate will probably try to get its money back on a stock proposition. The price paid was over \$100,000.

The new vein on the Waldman shows high grade ore at the 65-ft. level. This vein is distinct from the original vein, which dipped from the shaft.

Good ore has been encountered at the 75-ft. level of the Otisse Mine. The wall rock on both sides of the vein is well mineralized.

Cobalt Central.—At the 260-ft. level of this property a new shoot of high grade ore was encountered in a large calcite vein. The capacity of the mill will be increased from 80 to 125 tons per day.

Another high grade vein about 6" wide was struck on the 190-ft. level of the Cobalt Lake Mine. This is about the best discovery yet made on this property.

#### BRITISH COLUMBIA.

**Rossland.**—The Velvet-Portland Mine, owned by the New Velvet-Portland Mining Co., Limited, of London, Eng., has been leased to Mr. Edw. Ehrenberg, of Spokane, Wash., who expects to have a force of about twenty-five men at work within a very short while. This property lies eight miles west of Rossland; is developed to a depth of 400 feet and contains some fairly large bodies of gold-copper ore that will carry from \$20 to \$40 per ton in those metals, with a little silver. It looks as though the opening up of this property foreshadows the resumption of smelting at the Northport smelter, as this is the natural and economical smelting point for Velvet-Portland ore and concentrates. This again would seem to indicate that the Le Roi Mine may be shipping to the Northport smelter at no very late date. There is little doubt but this is the plan of the Le Roi Co.; that is, to ship ore as soon as it seems advisable and resume smelting operations at Northport. There are several Washington mines that would contribute ore to the Northport smelter, in case work was again started up at that point, which would help to make the plant pay, and cut down the cost of smelting as a whole to an economical figure.

Diamond drilling in the Le Roi mine is being prosecuted as rapidly as three machines can drive the holes. Some good ore

that has been uncovered is being stoped and stored, ready for shipment to the smelter.

The work of sinking the Josie shaft on the Le Roi 2, Ltd. is going on steadily, and shipments have come up to the regular figure again, being 490 tons for the week ending Oct. 2nd.

It is stated that at the meeting of the Consolidated Mining & Smelting Co. of Canada, Limited, to be held in Toronto, Oct. 12th, the proposition to increase the capital of the company from \$5,500,000 to \$7,500,000 will be seriously considered. Of course this concern has adopted an extensive policy that not only requires a lot of money but warrants a good capitalization. Since the organization of this company, when over five million dollars was written off the old capital of \$10,266,667, making the new capital \$4,698,800, three years of splendid progress have been accomplished. The plant at the Centre Star group, in Rossland, has been made up-to-date and substantial; a hundred improvements have been made at the Trail smelter and refinery; the Snowshoe mine has been placed upon a producing basis, properties have been acquired adjoining the Snowshoe, in the Slocan, Wellington, and half-a-dozen more good claims have been secured adjoining the Centre Star group. Of course, three years' ore has been extracted from the Centre Star-War Eagle, St. Eugene and other mines of the company, but the extraction has been along sane lines and development work to-day is well advanced and there are large quantities of ore ready for stoping or "in sight." So it appears that there is nothing unreasonable in the consideration of an increase of capital at this time, as it is practically assured that good use will be made of such capital. The Phoenix Amalgamated group is about to be put on a producing basis and other important work outlined. It takes a large amount of capital to mine the semi-low grade ores of Rossland or the low-grade ore of the Boundary, if a company is after legitimate results.

During July and August the gross output of the Consolidated smelter and silver-lead refinery at Trail was \$985,000, as compared with \$635,000 for the same period in 1908. Progress is manifest in these figures to the extent of 55 per cent. for one year. An addition is being made to the lead refinery which will increase its capacity from 70 to 120 tons per day. There are now 240 working tanks in the plant and 180 more are being put in, which, with the settling tanks, etc., will make a total of 596 tanks in the building, which is to be lengthened to 600 feet.

**The Boundary.**—It now appears that we are approaching the climax of the Dominion Copper drama. It is announced that the British Columbia Copper Co., in view of its arrangement with the New Dominion Copper Co. to treat the ore from its mines, is to enlarge its Greenwood smelter, and will build an additional furnace 56 in., by 30 ft., thus augmenting the capacity of the Greenwood plant from 2000 to 3000 tons per diem. The Rawhide mine of the New Dominion Copper Co. will be the first one opened up, and it is thought that October will see the first work begun. This property has probably more ore ready for stoping in its depths than any of the other mines of the Copper Co. It is estimated that the probable reserve in the Rawhide and Idaho mines of the company is between two and three million tons, that should carry \$1 in gold, 18c. in silver and 22 lb. copper per ton. This ought to give a net recovery of 17 lb. copper and \$1.15 in gold and silver per ton, from which it may be calculated that in order for the company to make a profit of 40c. or 50c. per ton at existing prices it will be necessary to keep the mining charges down to about \$1.12 and smelting around \$1.25; converting, refining and marketing 46c. per ton; which, after the deduction of gold and silver will give approximately 10½c. copper.

The output at the Granby mines is being maintained at about 20,000 tons per week. This tonnage, however, will no doubt be increased to 23,000 to 25,000 tons per week when number eight

of the enlarged furnaces is blown in, about Oct. 10th; the full battery of eight furnaces will then be available and at times when none of them are shut down for repairs will be able to treat 28,000 tons per week and over. Working under these conditions would mean a production of 616,000 lbs. blister copper per week, as Granby ore nets approximately 22 lbs. copper per ton and carries \$1 and a little over in gold and silver. Improvements are continually being made about the Granby mines and smelter that with a smaller enterprise would receive considerable comment but which with this concern are passed over, only the big things being noted. At the present writing, new machine shops are being built at Phoenix, new brick thaw-house, an additional installation of electric underground locomotives, etc. About \$250,000 has lately been expended upon mine and smelter improvements, and it is now said that the Granby Co. will be able to produce its blister copper and market it at 8½c. to 9c. per lb. and this on a monthly average. The use of gravity has been worked down so fine that they now use even the cave-in principle. During dry weather and winter a lot of the work is done underground, work in the glory holes not being as favourable as during the summer months, and some of this underground work is done with a view to undermining large bodies of ore. This is comparatively safe as long as it is dry, but being of a lime formation, partly, the action of surface water causes the ground to soften and cave, when it is ready for the steam shovels. A big saving in labour and explosives is thereby effected.

The Oro Denoro mine of the British Columbia Copper Co. is again shipping ore to Greenwood at the rate of 300 tons per week. Twenty-five men are now working at the mine and the shipments will be increased from week to week until a good average is obtained. Large bodies of ore have been placed in Oro Denoro ground by the recent diamond drill operations. The B. C. Copper Co. is also planning to open up the Emma mine in the near future. Shipments from the Mother Lode mine increased 1,000 tons during the past week, and 8,800 tons was sent to the Greenwood smelter. The B. C. Copper Co. will not now begin diamond drill exploration of the several groups of claims recently bonded in Kamloops; this in view of the arrangement to treat New Dominion ore, etc.

An English syndicate has paid \$200,000 for 3,520 acres of coal land on Granite Creek, lately owned by the Tulameen Coal & Coke Co., a concern backed by Vancouver business men. The property is 11 miles from Princeton and will be near the Vancouver, Victoria & Eastern Ry. line, when it is finished.

**Nelson.**—There are two important issues in this district that affect the mining industry and thereby affect the Provincial and Dominion revenue and the revenue of the Canadian, British and foreign capitalists who have their money invested in British Columbia mines. These two issues are lead and zinc. A few years ago the Dominion government recognized that it was most advisable that the lead mining industry of this district should be nourished and the existing bounty on lead was the logical outcome. This measure was a great stimulus to the lead industry, but nature has taken a hand in the matter as work has gone on, and as many former lead mines have with work at depth, become zinc mines, we are now facing a zinc problem. The French capitalists who are working the Blue Bell deposits are doing their mite toward the solution of this problem; the Sullivan group has been acquired by a subsidiary company of the Federal M. & S. Co., of the United States, and as they will have plenty of capital, important work, will no doubt, be done at Marysville; a lot of Nelson capitalists, aided by the Provincial government, to the extent of \$20,000, have expended \$125,000, and five years of work on the electrical zinc smelting furnace. Just as they achieved their object, successful and economical smelting of zinc-lead ore, the money was exhausted, and now for lack of funds this Nelson plant is idle, whereas it should be working daily, and its capacity increased from its present capacity of 10 tons per day to 30, 60, 100, and even 200 tons per day. Overtures are being made to the Dominion government with a view to obtaining a reasonable amount of aid for this industry. There is no doubt that in the years to come the government would be richly repaid for any aid that it may give the zinc industry at this time.

The recently burnt headworks at the Silver King mine have been replaced and shipments will be resumed shortly. It is planned to run a high voltage electric power line from Bonnington into the Sheep Creek district. This will give the mines there power at about \$32 per h.p. per annum.

The last payment of the \$15,000 purchase price on the Van-Roi property will shortly be made. Most of the money has been taken from the mine itself. The gross revenue from operating the mine in August was \$17,582.

Ten thousand acres of Peace River coal lands have been taken up by Canadian capitalists. The deposits are said to be rich, of a good domestic coal, that will also coke to 86%. There are some vast fields of good coal in the Canadian Northwest, from Souris to the Coast and from the boundary line northward, which are bound to be an important factor in the industrial progress of this country, not only in years, but in epochs to come.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Halifax.**—In evidence brought out in the "conspiracy" case brought by the U. M. W. A. against coal operators of the province, it has been proved that there has been no increase in the price of Dominion Coal Company's fuel since 1902. Screened coal sold then, as now, for \$3 per ton; run-of-mine for \$2.75.

**Halifax.**—Unwonted activity in the transfer of gold-mining claims is noticeable. Some Cobalt names, notably that of Mayor H. H. Long, appear in late transactions. Toronto capital, also, has been attracted lately.

### ONTARIO.

**Cobalt.**—The concrete foundations of the Nova Scotia concentrating mill are being employed.

**Elk Lake.**—Thirty men are employed on the claims of the Tee-Arr Mining Co. The shaft has been sunk 65 feet, and native silver is showing up well in the north drift at that level.

No. 1 vein on the north-west claim of the Silver Alliance shows three inches of calcite, with occasional leaf silver. Air is to be supplied from the plant of the Elk Lake Discovery Co.

**South Lorrain.**—The Wettlauffer property is doing well. The

first car of ore yielded a gross amount of 55,000 ounces of silver. The next car is expected to average nearly 4,000 ounces to the ton. At a depth of 103 feet a new vein was struck. At 125 feet another vein is 10 inches wide, and assays more than 4,000 ounces to the ton. Between the two veins is five inches of country rock. The fracture and cleavage faces of the rock are coated with pyrrargyrite.

# BRITISH COLUMBIA.

**Fernie.**—For the week ending October 16th the output of the Crow's Nest collieries was 19,951, a daily average of 3,630 tons (five and one-half days). Of this total, 6,294 went to the coke ovens, the balance being sold to the railways. The daily average was only 136 tons less than the highest ever attained.

**Kaslo.**—The ore shipments over the K. & S. for the month of September totalled 1,855 tons, of which 1,270 were zinc and 585 silver-lead. The principal shippers were the Lucky Jim with 790 tons of zinc ore and the Whitewater with 300 tons of silver-lead and 280 of zinc. The Lucky Jim output was consigned to the United States Zinc Co. at Depue, Ill., and the Whitewater zinc product to the National Zinc Co., Blende, Col., and National Zinc Co., Bartlesville, Okla. The entire silver-lead output went to Trail. The Rambler shows an increased output over that of several months past, with a total of 180 ton of silver-lead, and the Cork is to the fore with 100. A gratifying showing is made with this season's tonnage when comparison is made with that of 1908. A year ago the combined output of all grades of ore amounted to 9,786 tons, this year so far the tonnage is 15,552, a big increase. This is more marked when it is noted that in last year's output is included the monthly shipments from Sandon, which point has been cut off from trans-

portation since last spring. Again, Bluebell's output for two months is not included in the Kaslo-Slocan section, and no mention at all has been made as regards shipments to the Highland-Buckeye at Ainsworth. The C. P. R. is expected to be running into Sandon in about a week, and for some time after connection has been made ore shipments from the Silver City will be heavy. Before 1909 passes into history we believe the combined tonnage of the Kaslo-Slocan district will establish a record untouched since the palmy days. The following are the mines and tonnage for September:—

## Silver-Lead.

|                           | Tons. |
|---------------------------|-------|
| Rambler . . . . .         | 180   |
| Cork . . . . .            | 100   |
| Whitewater . . . . .      | 120   |
| Whitewater Deep . . . . . | 180   |
| Index . . . . .           | 5     |
| Total . . . . .           | 585   |

## Zinc.

|                                 |       |
|---------------------------------|-------|
| Lucky Jim . . . . .             | 790   |
| Whitewater Deep . . . . .       | 330   |
| Whitewater . . . . .            | 150   |
| Total . . . . .                 | 1,270 |
| Total tonnage for month, 1,855. |       |

Total output of silver-lead and zinc ores of the district for the year to date, 15,552 tons. Added to this total are the shipments for September and August from the Bluebell. These are respectively 360 and 395 tons, bringing the grand total up to 16,207 tons.

# MINING NEWS OF THE WORLD.

## GREAT BRITAIN.

A general stoppage of work in all the iron ore mines of West Cumberland is threatened. The men demand increase of wages and complete recognition of their union. Their wages are now 17s less per fortnight than they were in 1907. It is claimed that trade is better and that wages should rise.

## AUSTRALIA.

The strike of the employees of the Broken Hill Proprietary Company, which was called on January 1st, 1909, cost the men £265,000 in wages, the company £33,600, and the transportation companies £160,000. Added to these losses are the losses of the New South Wales coal miners, part of whose regular market was cut off.

## EGYPT.

An important discovery of petroleum has been made at Jebel Tanka, on the Gulf of Suez. The oil springs are on the shore immediately in front of a high perpendicular cliff. The springs are covered by the sea at high tide. The fact that the oil is being forced up through tight joints in the rock is taken to indicate that great oil pressure exists below. An available supply of petroleum here will prove of immense importance to the British Navy.

## SOUTH AFRICA.

During July 1909, there were 9,620 stamps at work on the Rand. The corresponding number for July, 1908, was 8,975. Dividend declared during the first six months of 1909 amounted to £4,798,696.

## SOUTH AFRICA.

The West Rand Consolidated's twenty new heavy stamps have had a trial run and accomplished the satisfactory result of 15 tons per stamp per day with 100 mesh screening. The stamps are of 1,850 lbs. weight, and have a base of greater diameter and a larger mortar box than usual on the Rand.

The profits of the Summer and Jack during the past year were £716,000. All ore carrying more than 3 dwts. is regarded as payable, owing to the low operating and milling costs. The ore reserves are estimated at 2,500,000 tons, averaging more than 61½ dwts.

## RUSSIA.

**St. Petersburg.**—The director of the Baku-Black Sea Company telegraphs to the St. Petersburg Press confirming the news of the spouting of a great gusher on their property at Maikop, near the Black Sea coast. On 12th September it began, and took fire three days later. After tremendous efforts the fire was extinguished on the fourteenth day after spouting. It is estim-

ated by the district engineer Markovsky that it has already thrown out 2,000,000 poods (32,250 tons) of naphtha. Though plugged, it burst through again on the sixteenth day, and is delivering about 40,000 poods a day. This is an event of great importance as showing plentiful reserves of oil within easy shipping reach of foreign ports. The district has long been the scene of careful boring.

The following figures, showing the output of copper in Russia and the outlook for an increased production in the future, are furnished by the American Consul at Moscow in a recent report. The output amounted to 10,306 tons, 14,554 tons and 16,591 tons in 1906, 1907 and 1908 respectively, showing a steady increase. Deposits of copper in the Caucasus are said to present vast opportunities, and enormous beds of coprolites exist in Central Russia and in the Dniester basin, the quantities in the latter alone being estimated as high as 27,000,000 tons.

The production in the several districts in 1908 were as follows, in tons: Ural, 8,429; Caucasus, 4,780; Siberia and Kirghis, 2,516; all other districts, 966. The consumption of copper in

Russia in 1908 was as follows: Produced in the Empire, 16,478 tons; imported, 4,855 tons; total, 21,333 tons, less 113 tons exported. The prices in Moscow during 1908 ranged from 27s to 34s per pood of 36 lbs.

#### MEXICO.

The total percentage of recovery of the metal contents of the ore at the plant of the El Oro Mining and Railway Company is 89.41 per cent. The total working expenses are \$5.42 per ton. Apart from development, etc., the actual mining and milling costs average \$4.22 per ton.

Four months ago the Federal regulation providing for drawback of duties on mining and metallurgical machinery expired. Refunds can now be secured only by personal application to the Department of Fomento. Such applications must be accompanied by complete data descriptive of the plant at which the importer intends to use the machinery. This tends to prevent any but the largest concerns from availing themselves of the drawback.

## COMPANY NOTES.

### LA ROSE CONSOLIDATED MINES COMPANY LIMITED.

Apart from certain features, to be noted in a forthcoming issue, the second annual report of La Rose Consolidated Mines Company, Ltd., is a satisfactory document.

In his summary, Mr. R. B. Watson states that approximately 3,000,000 ounces of silver have been produced at a total cost of 16 cents per ounce. At a selling price of 51 cents, the net profit per ounce is 35 cents. The net profit, including receipts from sales of cobalt and arsenic, amounted to \$1,090,040 for the fiscal year ended May 31, 1909. For comparison it may here be mentioned that the net profits distributed among owners of La Rose mine from July, 1904, to May 31, 1908 (vide Report, June 20, 1908), totalled \$1,006,040.82.

The earnings for the fiscal year came entirely from La Rose mine, which also financed the equipment and development of the outside properties. The Lawson was acquired in April, 1909, and thus little work could be accomplished before the end of the fiscal year.

Mr. Watson mentions that, as might be expected, considerable sinking and development is necessary before the Lawson can produce steadily. No stopping has been done on the Princess. Apparently the only encouraging symptom here is the cutting on the 135-foot level of the vein originally found on the 50-foot level.

**Production.**—The production of the La Rose properties for the year is shown in this table:—

|                  | Tons.      | Ozs. silver. | Net value.     |
|------------------|------------|--------------|----------------|
| La Rose .....    | 6,141.8475 | 279,953.97   | \$1,346,161.63 |
| Princess .....   | 7.6345     | 19,331.71    | 9,167.25       |
| University ..... | 24.3790    | 6,077.56     | 5,710.87       |
|                  | 6,173.8610 | 3,005,383.24 | \$1,363,039.75 |

Shipments for the year ending May 31, 1909:—

|                                                            |                |
|------------------------------------------------------------|----------------|

| Gross ounces silver contained .....                        | 2,915,706.58   |
| Gross silver value .....                                   | \$1,492,046.70 |
| Average price received per oz. cents .....                 | 51.173         |
| Received from sales of Cobalt .....                        | \$ 24,059.52   |
| Received from sales of Arsenic .....                       | 322.15         |
| Gross silver values plus Cobalt and Arsenic paid for ..... | \$1,516,428.37 |
| Smelter deduction, freight and treatment \$ .....          | 196,280.45     |
| Net value received from ore sales .....                    | \$1,320,147.92 |

### TYEE COPPER COMPANY.

The tenth ordinary general meeting of the Tyee Copper Co., Ltd., was held on September 30, at Cannon Street Hotel, London, E.C. Mr. T. H. Wilson acted as chairman.

The chairman announced that the Board of Directors had considered it inexpedient to issue a detailed balance sheet. Following the practice of all other smelting companies a condensed balance sheet had been prepared. No dividend was to be declared for the past year, as a loss of £22,646, 4s, 1d, has been incurred. This amount was made up principally by the items of £5,066, 9s, for depreciation on properties; £3,097, 18s, 1d on plant and buildings; £6,666, 15s, 5d loss on outside mining operations; and £3,034, 9s, 7d in inspecting various properties. Depreciation was allowed for at the regular rate of 10 per cent.

The smelting of customs ore, it was stated, is increasing steadily, the year ending with the last of August, 1909, was the best since 1905. The copper produced amounted to 3,245,424 lb. The second furnace is now completed and working satisfactorily. The two furnaces combined are capable of treating over 12,000 tons of ore per month, working only 25 days. This equipment is placed on the balance sheet at the low valuation of £28,712, 14s, 2d. During the past year one furnace only was in use for seven months.

The report and accounts were accepted after a warm debate. Several shareholders insisted that a detailed balance sheet should be given. It was explained by the chairman that since the company is now a customs smelting concern it would be decidedly bad business to divulge particulars of operations. The vote stood 19 for and 12 against.

The Kerr Lake dividends are payable December 15. The new rate of quarterly dividends is equal to 35 per cent. per annum. At a meeting of directors held on Oct. 15, Julius A. Lewisohn was elected a director of the company.

Tyee Copper results for the month of September, 1909, are as follows:—Smelter ran 16 days, treating 4,000 tons of ore, producing a total of 416 tons of matte.

### LAKE SUPERIOR CORPORATION.

The report of the Lake Superior Corporation for the year ended June, 1909, states that the income derived from the subsidiary companies was £501,424, while interest and miscellaneous receipts amounted to \$65,087, totalling \$566,511. Interest and

general expenses, including interest on First Mortgage and Collateral Trust bonds, absorbed \$543,516, leaving a surplus of \$22,995. The result of the year's operations of all the subsidiary companies of the corporation, complied without provision having been made for bad and doubtful debts, depreciation and renewals, shows a surplus for the year of \$1,093,372. Of this amount, \$501,424 has been paid to the Lake Superior Corporation in interest and dividends. The remainder of the surplus has been set aside by the subsidiary companies, as in previous years, to-

wards providing for such depreciation, etc. In view of this, the directors have not felt able to pay interest on the income bonds for the year. They are confident, however, that their decision will be approved by the income bondholders. When the reorganization of the corporation was consummated in 1904, an amount was provided for working capital, which proved quite insufficient for the needs of the various companies. The result was that the companies were forced to borrow heavily from the banks.

## STATISTICS AND RETURNS.

### COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt Camp for the week ending Oct. 16, and those from Jan. 1, 1909, to date:

|                                                                               | Oct. 16.    | Since Jan. 1. |
|-------------------------------------------------------------------------------|-------------|---------------|
|                                                                               | Ore in lbs. | Ore in lbs.   |
| Cobalt Central .....                                                          | 44,442      | 685,196       |
| Crown Reserve .....                                                           | 115,420     | 4,923,894     |
| La Rose .....                                                                 | 381,434     | 10,397,882    |
| McKinley Dar. ....                                                            | 89,706      | 1,643,424     |
| Nipissing .....                                                               | 129,402     | 10,317,618    |
| O'Brien .....                                                                 | 64,042      | 2,215,649     |
| Silver Queen .....                                                            | 86,449      | 684,844       |
| Silver Cliff .....                                                            | 58,000      | 241,820       |
| Trethewey .....                                                               | 65,000      | 1,678,698     |
| Ore shipments to Oct. 16, from Jan. 1, are 46,315,563 pounds, or 23,157 tons. |             |               |
| Total shipments for week ending Oct. 16 are 947,446 pounds, of 473 tons.      |             |               |

### COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt Camp for the week ending Oct. 23, and those from Jan. 1, 1909, to date:

|                      | Oct. 23.    | Since Jan. 1. |
|----------------------|-------------|---------------|

# Mining Companies

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing, and distributing Annual Statements, Special Reports, Descriptive Pamphlets, Prospectuses, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction. We are making a specialty of engraving and printing bonds, stock certificates, professional and business stationery, business cards and all such work. Orders from mining districts will receive prompt attention.

We shall be glad to furnish estimates to enquirers.

Now Ready

## Richard's Ore Dressing

Volumes III and IV

Per Volume \$5.00 [21s] Net Postpaid

The Set, 4 Volumes, \$20.00 [£4 4s] Net Postpaid

NOTICE—The index for all four volumes will be issued separately and supplied free at an early date to all purchasers of Volumes III and IV.

It required two large volumes to cover the new machinery, processes, discoveries and data in ore dressing. These volumes supplement but do NOT SUPPLANT I and II.

In general arrangement Volumes III and IV are similar to Volumes I and II. The Chapters are each intended to supplement the subject-matter of the corresponding chapters in the earlier volumes, describing new machines, new processes, and giving new data. The greatest care has been exercised in avoiding repetition.

Since the issue of the earlier volumes, many important discoveries have been made and radical departures introduced in established processes. Volume III, for example, has complete discussions of fine grinders, particularly the tube mill and grinding pans, rectilinear tables of the Wilfley type, the questions of magnetic separation, electrostatic separation, the flotation processes, and other subjects of like importance not covered in the earlier volume.

When Volume I was issued, the tube mill, which has almost revolutionized gold and silver milling practice, was

hardly touched upon. The Wilfley table was just finding its place among mills, and a number of other tables of the same type have been developed since.

Volume IV describes in detail some 94 complete mills, showing the most approved modern and successful methods of applying ore-dressing principles in use to-day throughout the mining districts of the world. Comparisons are made with earlier descriptions to show modifications and improvements, and to point out errors in older plants.

Throughout both volumes, much space and great care have been devoted to the general subjects of costs of operation, speed, capacity, water power, life of machines, etc. Power and water plants are described in connection with nearly every mill.

Complete Bibliographies are added. The Index for the entire four volumes has been remade and will be bound separately. It will be furnished without charge to purchasers of Volumes III and IV.

Book Dept. Canadian Mining Journal - Toronto

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## THE ROAD TO GOWGANDA

BY THE  
CANADIAN NORTHERN ONTARIO ROUTE

is thirty miles shorter than any other. Beginning February 2nd, through sleepers leave Toronto, 5 p.m. arriving Sellwood (Moose Mountain Iron Mines) next morning. (Breakfast served on train.) From Sellwood to Gowganda is one day's sleigh ride over the company's own road; comfortable road houses are stationed at easy distances and a fast freight and passenger service has been inaugurated with all points in Canada. Inquiries invited:—

Wm. Phillips, General Freight & Passenger Agent, - } King and Toronto Streets,  
C. Price Green, Passenger Agent, - } Toronto

HALF CALF - \$7.50

Book Dept. Canadian Mining Journal - - Toronto

**CANADA.—DEPARTMENT OF MINES.****Geological Survey****PUBLICATIONS**

The Geological Survey has published maps and reports dealing with a large part of Canada and with many local areas and special subjects

**MARITIME PROVINCES**

The whole of Cape Breton and a large portion of the coal and gold fields of Nova Scotia have been reported upon and mapped on a scale of 1 mile to 1 inch. The remaining portions of the province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter provinces, mapped on a scale of 4 miles to 1 inch.

**QUEBEC**

Quebec, south of the St. Lawrence, has been reported upon and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the province north of the St. Lawrence are also available.

**ONTARIO**

A large part of the province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

**THE PRAIRIE PROVINCES**

Geological maps and reports have been issued covering the greater part of the provinces of Manitoba, Saskatchewan and Alberta.

**BRITISH COLUMBIA**

The southern portions of British Columbia, as well as other parts of the province, have been reported upon and mapped.

**YUKON**

Many of the important areas in the Yukon have been reported upon and mapped.

**THE NORTH-WEST TERRITORIES**

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

*Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

**THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:****NOVA SCOTIA**

- 1019 City of Halifax Sheet.  
1025. Waverley Sheet.

The above two sheets belong to the regular series of Nova Scotia map sheets on a scale of one mile to one inch. The first includes Halifax City and Harbour, the second the Waverley Gold District.

**ONTARIO**

1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

**BRITISH COLUMBIA**

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shows the geology and location of veins.

1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch, by W. H. Boyd.

NOTE.—Maps recently published may be had on linen cloth for use in the field at the price of 10c. per copy.

**REPORTS**

1072. Summary Report of the Operations of the Geological Survey for year 1908.

The Geological Survey, under certain limitations, will give information and advice upon subjects relating to general and economic geology. Mineral specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

*Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are : Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc ; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows :

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

**Miners' Certificates** good for a calendar year may be obtained by sending \$10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of \$10.00 plus a yearly rental of \$1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed

territory may be purchased as a mining concession at the price of \$20.00 per acre if within 20 miles of a railway in a straight line, or \$10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

**The Hon. Minister of Colonization, Mines and Fisheries  
Quebec.**

## Province of Nova Scotia

**Leases for Mines of Gold, Silver  
Coal, Iron, Copper, Lead, Tin  
AND  
PRECIOUS STONES**

*Titles given Direct from the Crown, Royalties, and Rentals Moderate*

Copies of the Mining Law and any information can be had on application to

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver; \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals; or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,039 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

Or **WM. FLEET ROBERTSON**, Provincial Mineralogist, VICTORIA, B.C.

## The Crow's Nest Pass Coal Co. LIMITED

### OFFICES

**Manning Arcade, Toronto**  
**Fernie, British Columbia**

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

### Our Analyses Speak for Themselves.

**CHAS. SIMISTER,**  
General Superintendent.

**J. D. HURD,**  
General Manager.

## WHY IS IT

THAT SALES OF

**MORTON'S**

**"B C"**

## Drill Steel

ARE INCREASING EVERY DAY?

MUST BE IT IS BETTER MATERIAL,

**Gives Best Satisfaction**

AND THE DRILL

**Lasts Longer.**

COULD ANYONE EXPECT MORE?

IN STOCK WITH

**E. G. PRIOR, Victoria, B.C.**  
**CANADIAN RAND CO., Cobalt.**  
**BAINES & PECKOVER, Toronto.**  
**ANGEL ENGINEERING & SUPPLY Co.**  
**St. John, Nfld.**

*Canadian Representative*

**D. W. CLARK, P.O., Box 521, Toronto.**

## The Longest Continuous Double Track Railway in the World Under One Management.

### The Great Double Track Route Through Canada.

Fast passenger service from the Atlantic Ocean to the head of the Great Lakes. The line taps all the principal commercial centres in Canada and reaches the important points in the States of Maine, New Hampshire and Vermont, the principal towns and cities in the Provinces of Quebec and Ontario, and many important places in the States of Michigan, Indiana and Illinois.

## The "International Limited" (Canada's Railway Greyhound)

### The Finest and Fastest Train in the Dominion

Runs every day in the year leaving Montreal at 9.00 o'clock in the morning for Toronto, Hamilton, Niagara Falls, Buffalo, Detroit, Chicago and intermediate points.

Write for copy of "Trains 3 and 4" descriptive of the route from Chicago to the sea, to J. Quinlan, Bonaventure Station, Montreal, or to J. D. McDonald, Union Station, Toronto.

**W. E. DAVIS,**  
Passenger Traffic Manager,  
MONTREAL.

**G. T. BELL,**  
Assistant Passenger Traffic Manager,  
MONTREAL.

**GEO. W. VAUX,**  
General Passenger Agent,  
MONTREAL.

# The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch. If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers kindly mention this Journal.

Quotations for Tee Rails, Fish Plates, etc., promptly furnished.

Catalogues sent on application.

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

General Passenger Department, Intercolonial Railway  
MONCTON, N.B.

# Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

## Canadian Westinghouse Co., Limited

## HAMILTON POWDER COMPANY

Head Office: 4 Hospital Street, Montreal

MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and Sporting Powder, etc.

Safety Fuse, Electrical Fuses, Batteries, and other Accessories.

### NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

### "WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

### "AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

### PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

COBALT TORONTO KENORA WINNIPEG, MAN.  
VICTORIA, B.C. VANCOUVER, B.C. CALGARY. ALTA. NELSON, B.C.

Three Post Magneto Electric Blasting Machine

When answering Advertisements please mention THE CANADIAN MINING JOURNAL.

## The "Little Hardy" Coal Cutter

Holes at Floor Level or Roof Level or in any intermediate position in Coal or Dirt Band, &c.

Equally suitable for Holing and Shearing.

The Lightest Coal Cutter in the Market.

Nearly 700 Machines at work. 93 in use by one Canadian Company.

## The Hardy Simplex Hammer Drill

Weight 22 lbs. Bores 6 ft. Deep.

Automatically Rotates the Drill Steel and lows out the Cuttings  
FOR SINKING, &c.

### SOLE MAKERS

The Hardy Patent Pick Co., Limited  
SHEFFIELD, ENGLAND

Stocks of these machines kept by Messrs. A. C. Thompson  
Co., Limited, North Sydney, Nova Scotia, Canada.

## TRY A "CLEVELAND"

We would like to have a personal talk and make a demonstration to every superintendent and foreman in Canada, for we know we could convince them of the superiority of "Cleveland" Stope Drills. A talk is out of the question but we can make a demonstration if you will give us the chance by sending you one for trial

## IN YOUR OWN MINE

After it has been in operation 30 days you can send it back if it isn't entirely satisfactory.

# Behrend Concentration System

## Combination WET and DRY

A complete recovery from all slimes and minerals such as Graphite, Galena, Stibnite, Chalcopyrite, Tetrahedrite, Sylvanite, Molybdenite, Stephanite, Argentite, Ruby Silver and and Native Silver.

This system will make low grade deposits pay. Every mine having an eye to business should investigate this system which has the approval of leading mining authorities.

A completely equipped plant, including concentrators, crushers, rolls, etc., for testing purposes is located at address below. Forward a sample of your ore for preliminary test.

## Carbons

(Black Diamonds) for Diamond Drills

Largest carbon ever found.  $\frac{1}{4}$  actual size.

NOTE. We personally break (in this country) our carbons, thereby enabling us to determine accurately their quality. We deal only in very best quality and are always ready to ship goods on approval and for selection to responsible parties. Write us.

## A Lesson in Economy

There are Rock Drills on the market to-day that at first appear a little lower in price than our machines, but when the matter of efficiency, durability and economy is taken into consideration, they cost, in the long run, from 25 to 35% more. We are prepared to back up our contention in this respect by actual facts. A thorough trial will convince you of the merit and economy of our tools. Write us for catalogue No. 27 descriptive of our many different devices for the development of mining claims.

### BRITISH AND GERMAN IRON AND STEEL TRADE.

British economists are persistently calling attention to the rapid growth of Germany's iron and steel trade. Since the year 1897, when the export bounty policy was put in operation, Germany has steadily overtaken her commercial rival. British exports of iron and steel amounted to 3,318,000 tons in 1897. In the same year Germany exported 1,069,000 tons. But during 1908 Germany's trade had grown to such an extent that exports totalled 3,732,000 tons, while Great Britain's exports aggregated only 4,233,000.

This comparison is more strongly in Germany's favour when we consider that fully one-third of Great Britain's iron exports may be classed as pig-iron. German exports of pig-iron, on the other hand, constitute hardly a twelfth of her total, and the proportion is constantly decreasing. The commercial gain to Germany, in thus selling finished products abroad, instead of raw material, is enormous.

A review of natural conditions affords no key to the situation. Raw materials can be assembled in Great Britain more cheaply than in Germany. British coal is cheaper and better. There is no great disparity in cost of labour; although the cost of living is cheaper in Germany. Transportation facilities are better in England than in Germany. What, then, has enabled Germany, with her lean ores and her poor fuel, to gain so remarkably upon her wealthier and more favoured neighbour?

In the face of natural disadvantages, Germany has sprung into second place as a producer of iron and steel. At the same rate of expansion Germany's export trade will soon eclipse that of Great Britain.

As we have seen, neither to geographic nor to other natural advantages can German progress be attributed. One outstanding feature, however, explains the strength of her position. The German iron and steel trade is perfectly organized. By a system of differentiated syndicates, not only is the trade, foreign and domestic, regulated, but a schedule of co-operative bounties was most successfully applied for a period of some years. Simultaneously with a slackening in domestic demand, the bounties rose so as to enable German manufacturers to dump their products on the British market. Similarly, when the domestic demand was strong, the bounties were lessened. Thus production was maintained, and the entire iron and steel industry kept continuously active.

The bounty regulations were in force through the period, 1897-1905. During that space of time German iron and steel exports increased 200 per cent.

That the stimulus thus administered induced a wholesome growth is not to be denied. But it was successful solely because of the complete and effectual syndication of the iron and steel interests. Each of the numerous

syndicates controls distinct kinds of products. The whole country is divided into zones, and, in the allocation of orders, the general welfare of all constituents is considered. Thus it is usual for a British order to be allotted to one particular district, Russian orders are usually placed in another, and so on. That is, foreign orders are allocated where they can be filled most advantageously. Geographical position, equipment, cost of production, are all considered.

In the development of Great Britain's iron and steel trade no such control has been present. Combinations, large and small, have been organized, but competition between individual interests has prevented any approaching the convention that exists in Germany. No tariff protects the British manufacturer. The national temperament does not take kindly to the rigid organization that appears to be the central idea of German civilization.

But, be these reasons sufficient or insufficient, the fact remains that Great Britain is falling behind, and that Germany, to a marked extent, is profiting by Great Britain's recession.

The hopeful aspects of the situation are that Great Britain is slowly becoming aware of the truth, and that she has natural advantages far greater than those with which Germany is endowed.

### LA ROSE AFFAIRS.

The first Report of La Rose Consolidated Mines Company was dated June 20th, 1908. Appended to this are three reports on the physical condition of the properties of La Rose Mines, Limited. The specialists engaged to report were, respectively, Messrs. Watson & Watson, Mr. T. R. Drummond, and Prof. Willet G. Miller.

Dr. W. G. Miller, whose report is dated August 9th, 1907, figured the silver content of ore blocked out on two sides in La Rose, 6,518 tons, at 8,020,870 ounces. Ten months later Messrs. Watson & Watson arrived at an estimate of 4,894,065 ounces as the silver contained in 10,358.17 tons of ore "practically developed" and ore "indicated." About the same time, Mr. T. R. Drummond estimated 5,303,000 ounces of silver as the probable yield of 5,484 tons of "ore available." While the basis of comparison is uncertain, owing to the divergent terminology and methods employed in the three reports, they may be used to indicate the general conditions of the mine. Mr. Drummond's estimate covers less territory than does the report of the Messrs. Watson. His figures are considerably higher for the main vein, No. 3 vein, and McDonald No. 5. Hence it is most suitable to take, for purposes of discussion, the Watson estimate of 4,894,065 ounces as the amount of silver indicated at the end of the fiscal year 1907-1908.

The output of La Rose as between August, 1907, and June, 1908, was approximately 900,000 ounces.

Taking Dr. Miller's figures, and disregarding any reserves added during that period, this would leave 7,120,870 ounces of silver in ore blocked out on two sides. As noted above, the total "practically developed" silver in almost twice the tonnage of ore, ten months later, is given by Messrs. Watson & Watson as 4,894,065 ounces, a discrepancy of more than two million ounces.

During the fiscal year ending June 1st, 1909, silver was shipped from La Rose to the amount of 2,979,953.97 ounces. Partly developed ore at that date is reported by Mr. R. B. Watson to contain 4,307,705 ounces. To this total may be added 454,013 ounces contained in "McDonald" country rock, and 206,700 ounces "indicated" in No. 3 vein, making a grand total of 4,968,418 ounces contained in ore reserves.

As plans and sections of the mine do not accompany either the annual or the special reports, and as Mr. Watson makes only vague reference to progress and does not specify the footage made on any vein, it is impossible to analyze the figures referred to above. We may remark here that this omission is inexcusable. Shareholders should insist upon detailed information as to progress and development. That this is necessary is amply proved by the history of La Rose itself. The general manager's report should be an actual history of work done in each section of the mine. If this has been prevented heretofore by speculative interests there is all the more reason that the objectionable policy of repression be discontinued at once. In this we are confident that General Manager R. B. Watson will concur. He is looked upon as a competent engineer. Until now he has had no opportunity to prove himself anything but an important cog in an elaborate stock-market device.

Roughly, the position of La Rose to-day may be summed up thus:—

The total capitalization is about \$7,500,000. Since organization of La Rose Consolidated the net value of silver shipped aggregates now about \$1,750,000. No profits to be expected from ore reserves, on Mr. Watson's estimate, will hardly equal this sum. No substantial development work has been performed on the other properties. Lawson, according to general belief, has not by any means lived up to its promise. The attention of the executive has been devoted, not to putting La Rose and the subsidiary mines in good condition, but to unloading their stock at the top of the market. Having accomplished this, most especially and most regrettable in London, the chief manipulators resigned and new directors were appointed.

We may interject here one or two questions that are decidedly pertinent. As pointed out above, there is a possibility of comparing the three estimates mentioned in our first paragraph. But we may ask Mr. Watson, in estimating his reserves, he is revaluing part of his reserves, or touching new ground entirely? What are where are his reserves, anyway? How do they che

with Dr. Miller's estimate of "tonnage and possible tonnage" published in the First Annual Report, which places the total productive capacity of veins then known at 12,871,750 ounces? Indeed, the more we examine the published statements of La Rose Consolidated, the less we find to enlighten us. But it is surely unfair to expect us to accept bald statements of reserves with absolutely no physical data.

It is not our belief that La Rose is to be a fiasco. A competent general manager, strong enough to resist market influences, and backed by the majority of his directors, will undoubtedly pull the fat out of the fire. We hope that La Rose possesses both the proper manager and the proper directorate. We do not *know* that this is the case. Knowledge will come soon enough.

### LIBRARY MEMORIAL TO HUGH FLETCHER.

The Mining Society of Nova Scotia has decided to raise four thousand five hundred dollars for the purpose of establishing a Memorial Library in honour of the late Hugh Fletcher. The library will consist entirely of books on geological and mining subjects. The Provincial Government is to be asked for permission to place the library in the new Technical College building.

British business enterprise is in nothing more evident than in the shipments of coal to Europe. Austria, for instance, is largely supplied by Great Britain. Trieste, on the Adriatic coast, is an important industrial centre and distributing point. To this city Great Britain shipped 804,000 tons of sea-borne coal during 1908. More than half of this quantity came from Northumberland, the remainder from South Wales and Scotland. Entries of Austro-Hungarian coal amounted only to 73,000 tons.

### RADIUM.

A significant event was the laying of the foundation stone of a large radium reduction works at Limehouse, England. The ceremony took place on October 16. Lady Ramsay, the wife of the renowned scientist, Sir William Ramsay, laid the stone.

This new enterprise, launched under the name of the British Radium Corporation, is the outcome of a combination of interesting and peculiar circumstances.

Associated with the British Radium Corporation is the St. Ives Consolidated Mines, Ltd., which controls an important group of tin mines in Cornwall. Among these tin mines is the Trenwith, which, in former years, was a copper producer. Early in the last century, so run the records, pitchblende was found in quantity. This mineral the miners mistook for black copper. On account of this delusion there was serious friction with the smelters. But the difficulty was cleared in 1843, when Professor Henwood identified the mineral rightly as pitchblende. After that this valuable ore of radium and uranium was considered a waste product.

The British Radium Corporation was organized to treat this neglected ore. The process to be used was devised by Sir William Ramsay. The method now in use on the Continent occupies at least twelve months. By Sir William's process a great saving of time will be effected. The whole treatment of the pitchblende will not occupy more than seven weeks.

The efficacy of radium as a cure for certain diseases, including cancer, is one of the beneficent discoveries of modern science. Sir William in his speech on this occasion alludes to the desirability of supplying the British Empire before allowing any of the precious element to be purchased abroad. Neither Austria nor Germany permits radium to be exported. Their example, according to Sir William, should be followed.

### CANADA'S ARCTIC DOMAIN.

History, written and unwritten, accentuates one fact. The nation that lays claim to territory must occupy that territory. The incidents of the Alaskan award, and of the adjustment of the International Boundary between Canada and the United States lend force to this. Skagway should never have been turned over to our neighbours; nor need it have been had Canada been early alive to her own interests.

In a recent newspaper interview, Mr. J. B. Tyrrell, who may be justly termed our leading authority on the Arctic and sub-Arctic regions of the Dominion, expressed his belief that the northern shore of the Dominion and the Arctic islands lying between the mouth of the Mackenzie River and the north-west extremity of Hudson Bay should be thoroughly explored. At present Canada has no substantial title to these lands. A vague suzerainty, based upon geographical considerations, constitutes our only hold upon territory that may be of immense value.

Mr. Tyrrell urges that the Dominion Government regularly appropriate a few thousands of dollars to equip an expedition to investigate the natural resources of these northern lands. This form of occupation has international value. It also may bring to light mineral deposits of great commercial importance.

Alaska, once looked upon as a white elephant, has returned a hundred times over the few millions paid for it by the United States, and its development has scarcely begun.

Disregarding altogether the sentimental aspects of the case, the exploitation of the Dominion's northern fringe is a practical duty that our Government must no longer neglect.

### CONCRETE IN METAL MINING.

Not only is concrete growing in favour as a substitute for timber in metal-mining, but the advantages of using it in sinking shafts in wet ground and in keeping water out of underground workings are rapidly being

recognized. Mr. Henry W. Edwards, in an article reproduced in this issue by special permission of The Engineering Magazine, outlines very usefully the uses of concrete underground.

We consider this article well worthy of reprinting. It brings before our readers a subject that will sooner or later obtrude itself in established mining camps. The utilization of concrete must command attention for several reasons. The supply of mine-timber gradually grows less. It is extremely difficult to conserve this supply. On the other hand, experience is proving that concrete may sometimes effectively replace timber, even where supplies of the latter are abundant. Concrete, moreover, can be utilized where timber cannot. Concrete is infinitely plastic and can be made to assume any desired shape. Its component materials can be assembled and mixed without excessive cost in almost any locality.

The whole question resolves itself into a problem of economics and of engineering skill. Only the fringe of the subject has been touched.

### THE ANNUAL REPORT OF THE ONTARIO BUREAU OF MINES.

Part I., Vol. XVIII., of the Annual Report of the Ontario Bureau of Mines appears just as we are going to press. In a later issue we shall discuss it adequately. At present we wish to express our appreciation of the careful and masterly Statistical Review that takes up the first seventy pages of this volume. The Deputy Minister of Mines, Mr. T. W. Gibson, is personally responsible for this section, and it is notably workmanlike, comprehensive, and clear.

### EDITORIAL NOTES.

The public will give thanks for the latest volume issued by the Geological Survey. "A Descriptive Sketch of the Geology and Economic Minerals of Canada," compiled by Dr. G. A. Young under the direction of the Survey. The book is a model of clean editing and intelligent selection. In both respects it is superior to any official Canadian publication. It gives a bird's-eye view of the economic geology of the Dominion. Extended notice is given on another page.

Western railroads have granted valuable concessions to the Los Angeles Chamber of Mines. The Chamber is endeavouring to assemble in Los Angeles a mining and oil exhibit. To aid this good work the railroad has consented to carry free of charge all ore and oil exhibits.

Shipments of 50,000 tons of Chinese pig iron are to be made to New York at prices that compare favourably with Pittsburg quotations for delivery on the

Atlantic seaboard. The chief iron works of the Chinese Empire are situated 750 miles inland on the Yangtse River, near Han Kow. Cheap labour, excellent ore and good coal all contribute to the low production costs. The possibility of such shipments being made re-adjusts our ideas of international commerce.

### MEXICAN MINING COSTS.

Mexico Mines of El Oro, Limited, is a corporation subsidiary to the El Oro Mining and Railway Company, Limited. It operates the Mexico mine, near the town of El Oro, Mexico. The company's record is worth noting.

Organized in 1904, the company had its plant completed and running in October, 1907. The positive ore reserves in June of that year amounted to 178,240 tons, carrying \$11.53 gold and 6.9 ounces silver per ton. The equipment as completed in October, 1907, consisted of a 40-stamp mill, six-tube mill, and a cyanide plant.

It was expected at first that the stamp-mill would crush 200 tons per day. In two years that expectation has been nearly doubled. At present the 40 stamps crush 378 tons per day, a duty of 9.45 tons per day per stamp.

Last year, ending June 30, 1909, the ore averaged \$13.47 in gold per ton. The mill treated 110,105 tons, getting an average extraction of \$12.44 per ton, a recovery of 92.35 per cent.—94.46 of the gold and 87.35 of the silver. During the previous year the recovery was 89.6 per cent.

The total working cost was \$5.67 per ton, as compared with \$6.33 for the preceding year. Development and State and Federal taxes amounted to \$1.64 per ton in the past year, while in the previous year they averaged only \$1.27. Thus the reduction in working costs is 40 cents greater than would appear.

By increasing the duty of the tube-mills it is hoped to bring the costs down still further.

The present ore reserves amount to 191,655 tons, almost two years' supply at capacity of mill.

### VOLCANIC GAS.

Through long years Mr. Eugene Coste has contended for the inorganic origin of natural gas and petroleum as opposed to the organic origin. Mr. Coste's papers on the subject in the publication of the Canadian Mining Institute have attracted much attention but his converts have been few. Of course most of us who have attended the annual meetings had to accept the theory (outwardly at least) and now it is receiving support from no less an authority than Dr. Becker, of the U. S. Geological Survey, "an unexpected source."

To Mr. Coste's long-continued, "vigorous, almost polemical, writing is mainly due the renewed interest in the long dormant theory of the inorganic origin of petroleum." Can we say to Mr. Coste "patience and perseverance made a bishop of his reverence"? Or is the conundrum sprung by that punster, Mr. Mickle, during one of the hot debates at a meeting of the Institute in Montreal some years ago appropriate: "What is the difference between a vegetarian and a man who believes in the organic origin of gas?" Give it up! "The one draws the line at meat while the other will swallow anything."

## HUGH FLETCHER.

Written for The Canadian Mining Journal by Mr. R. W. Brock,  
Director of the Geological Survey of Canada.

Through the death of Hugh Fletcher the Geological Survey lost one of its oldest and most respected officers. He was born in London, England, of Scotch parents in the year 1848. At the age of 12 he came to this country with his father, a well-known mining engineer.

His education was received in Ontario. At Toronto University he took a brilliant course, securing the gold medal in modern languages, the silver medal in natural science, and the Prince of Wales prize in general proficiency. His first practical experience was obtained in the gold mines at Tangier, N.S., where his father was manager. In 1872 he was appointed to the Geological Survey of Canada as assistant to Mr. Charles Robb, then engaged in a study of the coal fields of Cape Breton. Of Mr. Robb's work and the training he received while under him Mr. Fletcher always spoke in the highest terms. Upon Mr. Robb's retirement in 1875 Mr. Fletcher was given charge of the work in Cape Breton, and from that time until his death in the field, his life has been unsparingly devoted to the study of the geology of Nova Scotia. His work included the survey of Cape Breton and the counties of Cumberland, Colchester, Pictou, Antigonish, Guysborough, Kings, Hants, and a portion of Halifax.

For more than thirty years he has been an accepted authority on the geology and mineral resources of Nova Scotia, more particularly as regards coal and iron. The published results of his work are largely confined to Geological Survey publications as given in the appended list. Like that of many other strong men, the value of his work is in the inverse ratio to the number of printed pages describing it. The greater part is represented graphically on the maps which he made, Mr. Fletcher being a strong believer in this method of recording information and presenting it to the public. The long list of maps prepared under his hand on a scale of one mile to an inch, with every feature shown, accurately located, and in greater part from original surveys by Mr. Fletcher, evidences the patient, painstaking, untiring work of this geological explorer. These maps are accepted as standard for geographical features, as well as for geological. During his long life

of active research in Nova Scotia he steadily acquired a mass of detailed information concerning this province, so that his knowledge of it became encyclopedic. He was ever ready to give the benefit of his knowledge and experience to any enquirer. Probably the most valuable of all the assistance the Survey can render is not that given through the printed report, but that furnished by officers in the field to individuals on the ground. In Mr. Fletcher's case his assistance was cheerfully accorded, and to an unusual extent.

As his active field life was spent wholly in Nova Scotia it is there that he and his work (they are always associated) were best known. The high estimation in which both were there held would amply repay the most self-sacrificing public servant. It is to the credit of Nova Scotia that this appreciation was not withheld until too late to reward, cheer and inspire this devoted worker.

As might be surmised from his wide circle of friends and admirers, Mr. Fletcher possessed a striking and winning personality. He was intensely loyal to his ideals, devoted to what he conceived to be duty, and persistent in his endeavours. His work was characterized by care, accuracy and system. It is as yet too soon to estimate the place he will occupy among the unravellers of Canadian geology, but no matter what advances be made in the science, his work will remain as fundamental. New terms may be introduced and formations differently grouped and subdivided as further light is thrown on the geological problems, but when work has been done with the precision and care that characterizes Mr. Fletcher's, such changes are merely readjustments.

It was his ambition to finish the mapping of his portion of Nova Scotia, and to embody in one report the results of his years of labour. His first wish was practically realized. The last, unfortunately, was unattained, and must be undertaken by other hands. He died, as he would have chosen, in harness, and amid the hills of his well-loved Nova Scotia.

Mr. E. R. Faribault, his colleague in Nova Scotian geology, is an old assistant of Mr. Fletcher, and the training he received at his hands is reflected in the detailed accuracy of his work.

# APPLICATIONS OF CONCRETE IN THE METAL MINING INDUSTRY.

By Henry W. Edwards.

(Abstract of article from The Engineering Magazine reproduced here by special permission.)

Concrete, used for the mere purpose of supporting unsafe ground is gaining but slowly in favour, being confined for the present to an occasional tunnel portal, to lining shafts through surface soil down to solid rock, and to a very limited use of "stulls." In the coal-mining industry much greater use is made of concrete for all purposes; but it is not the intention in this article to touch upon that branch.

The chief advantage of concrete for lining shafts through the surface soil and down to bed-rock, outside of its durability, is its efficiency in keeping out water. The upper part of the lining is usually so shaped and extended as to form the foundations for the hoisting machinery. The rounding shape, or arched effect, shown in recent illustrations published, is of no particular advantage for vertical shafts, although it is quite necessary if the lining be made of brick or stone. Even in small mining operations, if the surface soil be wet no time should be lost in protecting the shaft with a watertight lining, which should be extended upward above the floor line sufficiently to form a kerb around the mouth of the shaft to prevent the rain water or rubbish from falling in. Arrangements for supporting the ordinary shaft equipment of cage-guides, ladders, pipes, etc., must be well thought out beforehand in order to avoid having to cut into the concrete after it has set. Shaft linings are comparatively simple in vertical shafts, but inclined shafts do not lend themselves quite so easily to placing the forms and ramming the concrete but not even these require any very high order of ingenuity. In this latter case the upper part had perhaps better be made arching and, if possible, reinforced either with specially purchased iron or with whatever old material may be available on the spot, such as old rail or pipe. A neat method for shaft lining is to make slabs of concrete three or four inches thick by two or three feet square, which when properly hard are placed and supported against the sides of the shaft, the space between them and the soil or rock being filled with concrete well rammed in; these slabs are left permanently in position.

It is as a means of controlling water underground that concrete is growing in favour rapidly. It is a much better stroke of business to keep water out of a mine than to pump it out. As an instance, at the Candelaria mine, in Mexico, the great influx of water was found to be at a point midway between the first and second levels, about 160 feet from the surface. A portion of this water was very ineffectually trapped on the second level by means of wooden troughs and pumped thence to the surface, but the great bulk of the water found its way to the bottom of the shaft at 700 feet. Raising the water from this depth to the surface necessitated a continuous effort at the pump to overcome some 630,000 foot-pounds. What with condensation in such a long steam line, pipe friction, etc., this amounted to something over 30 horse-power at the boiler. It was therefore decided to arch over the second level from the shaft completely to the end. This being done, the water, thus completely confined above the arch, was pumped only 200 feet to the surface. The pump at the bottom

of the mine was then able in a few hours' work per day to take care of all the water seeping into the mine below this level. The saving in reality was found to be more in money than was represented by the steam saved, the men being much more efficient in the more agreeable circumstances, besides the heavy bills for repairs to the pump being much diminished. The forms used in this work consisted of two segments from an old steam boiler, lapped over one another to a greater or less degree to accommodate the variable width of the level, the smaller irregularities being closed by scraps of boards or sheet iron or anything else that came handy. As elegance and finish are not considered necessary underground the marks left by these were not smoothed off. The preliminary work, having for its object the preventing of the water from washing over the wet concrete, was much more difficult and engaged much more attention than the mere construction of the arch.

At the San Blas mine, also in Mexico, in sinking a shaft 8 feet by 12 feet in area, a heavy flow of water was encountered at 90 feet from the surface, through a fissure which crossed the shaft at about a 25-degree angle. The flow of water was such that in spite of the most energetic efforts only eight feet of progress was made in a month. We therefore enlarged the shaft, in an irregular outline, for two or three feet on each of its four sides for a belt of about three or four feet above the fissure and about the same distance below. After the water had risen to its natural level in the shaft, some 250 tons of concrete were dumped in and allowed several weeks to set. The water was then pumped out and the shaft re-excavated through the concrete and carried down to 400 feet without further trouble. Had a central hollow core been left in the concrete the work of sinking through it would have been very much diminished. The total cost of this work did not exceed \$2,200, including the re-excavation of the shaft, the cement costing, delivered at the spot, \$4.50 per barrel.

It may be as well to indicate the precautions necessary to secure a successful issue to a piece of work of the above sort. First, the water should be without movement, or the flow be at least imperceptible. For this reason the shaft was allowed to fill up to its natural water level. Second, the concrete should not be dumped in and allowed to fall to the bottom, causing a separation of the heavier from the lighter ingredients. In the case cited the concrete was lowered in a wedge-shaped bucket, one side of which was hinged at the top and fastened at the bottom by a latch to which was attached a wire leading to the surface. When the bucket was lowered and placed as nearly as possible in position the wire was pulled, releasing the concrete without giving the cement much opportunity to separate from the other ingredients. Third, the re-excavation must be made without the aid of explosives. Fourth, ample time must be allowed for the concrete to solidify.

For "timbering" underground, concrete "timbers" are attracting a certain amount of attention. The average life of a pine timber or stull in a mine may not be counted on to exceed four years, while the life of a concrete "timber" is indefinite; it costs more in the

first instance and, owing to its weight, it is more costly to place in position. Concrete timbers are easily made in long wooden troughs, or in split tubes of sheet iron, with the ends adjusted so that they can be changed to suit the desired length and angle of cut. If it is possible to do so, the form should be set close to where the stull is to be finally placed. The conspicuous disadvantage of the concrete stulls is the difficulty in placing them at the proper angle with regard to the line of thrust of the ground to be supported. Frequently when the ground being supported settles to a small extent the angle of thrust is greatly changed; in such a case a pine timber is easily wedged up, or the ends cut to a new angle, or the position of the whole thing changed to suit the new conditions; once a concrete timber is in place any changes are very difficult. Up to the moment of writing, the greater use of concrete stulls and timbers is in replacing rotted ones. In this case the ground having already settled and the wooden stulls having been subjected to observation for a considerable period of time, the concrete props can be placed with more intelligence, not only as to the direction of the lines of force, but also as to the amount of strain they are to be called upon to resist. Both of these factors are usually only partially known in the first instance.

As a general proposition, the use of reinforcement, either of scrap material or of some one of the many special shapes of iron, is not very usual for underground work in the metal-mining industry. For surface structures, however, we follow all the usual rules of such constructions. Portions of the various structures in which the stresses are exclusively in compression do not require reinforcement.

These statements suppose the use of cement of good quality, which, in out-of-the-way places, is not always obtainable. It is of very little use to attempt to test the cement for the purpose of comparing the results obtained with the figures obtained by the manufacturers. So many factors are not uniform with the conditions under which the experiments are made at the factory that the final results are quite different. The age of the cement, difference of temperature and humidity of the air, of the water or of the cement itself, and even the nature and amount of the various mineral substances dissolved in the water, all together introduce such differences as to make it a waste of time to make any other tests than the actual mixing and laying of a small preliminary batch of concrete. About the only exterior indication of defective quality is the swelling of the barrels when they have been too long in stock in a humid climate or have accidentally been wetted. It seemed a pity that no way could be found to stamp each barrel reliably with the date it left the factory like the photographic supplies. If it be possible, the engineer will do well to purchase his cement direct from some manufacturer of a standard brand and not to depend on purchasing from local merchants.

As a general rule there is nothing at any mine in the way of surface structures that cannot be made, and better made, of concrete than of any other material—head frames, ore bins, floors, buildings, electric-wire poles, trestles, water pipes for low pressure, boiler settings, chimney stacks, tanks of all kinds, and even boats and lighters if the mine have use for these latter.

As to head frames, the strains of hoisting are converted entirely into compression in these structures, and concrete is, therefore, exceedingly appropriate. One of the most satisfactory head frames I have put in had for its principal members two old sheet-iron smoke stacks, each 28 inches in diameter by 50 feet high. These were

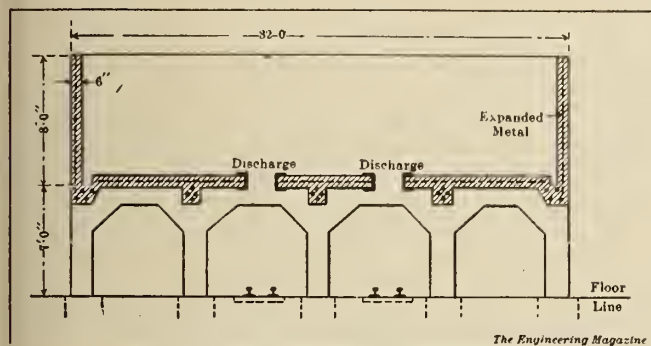

REINFORCED-CONCRETE BRIDGE FOR 20-INCH GAUGE MINE TRACK.  
For mule hauling three cars each 1500 pounds net load

filled with concrete, section by section. As just remarked, all the strains in these structures being resolved into compression in the direction of the resultant of the engine pull and the ascending load, it would appear that a head frame need consist of a single strut only, placed in the plane of this resultant, and that any other members would be superfluous except such feeble ones as might be necessary to support the main strut in the proper attitude while not in use. Concrete head frames are cheaper than steel, and, moreover, are not subject to the violent and unpleasant vibration of the steel construction. This vibration may be done away with entirely by casing the steel structure with concrete.

In the making of tanks for water or for the cyanide process or for slime settlers, reinforced concrete is most adaptable. Recent changes in the manipulation of the cyanide process have involved the use of tanks which rather puzzle the wooden tank manufacturer, particularly those tanks with conical bottoms. The maker's difficulty in these tanks comes in keeping the hoops from slipping down the conical part, or in finding any really satisfactory substitute for hoops. For the concrete man these difficulties do not arise; he has no bounds of shape nor size nor position, nor is he called upon to handle material of unusual dimensions, nor, like the iron tank man, is he obliged to send a gang of riveters, say from Pittsburg to Nicaragua, to rivet up a set of tanks shipped in sections.

CYANIDE VAT OF REINFORCED CONCRETE.

Another essential part of the cyanide plant is the system of launders or troughs for conveying the solutions from tank to tank. When made of wood these launders are not difficult, so long as they are straight; but when curves or junctions become necessary, then the difficulties of making them absolutely watertight begin. Concrete launders can be made as complicatedly crooked as may be convenient, with perfect freedom from leakage, and, moreover, if allowed to dry, they do not shrink, like wood, opening up cracks where none previously existed.

The former method of building cyanide tanks was by lining, with heavy concrete excavations partly or wholly below ground level. The modern reinforced concrete cyanide tank is an elevated structure upon concrete pillars, with its bottom and all its other parts as accessible to inspection and repairs as an iron or wooden tank. In the modern construction of cyanide tanks "expanded metal" or a system of iron rods and wires forms the reinforcement: the concrete, some 6 inches in thickness, is thoroughly trowelled over with neat cement on the inside in order to close up the pores of the concrete. Any offsets or fastenings for filters or outlets or inlets are all provided for in the wet concrete. Should small cracks develop so as to expose the iron reinforcement to contact with the cyanide solution, no

harm will result, as the solution is entirely without action on iron. A good preliminary paint coating may be made by emulsifying soap and water and kerosene oil (in about equal weights of the three ingredients), after which the tanks may receive two coats of the usual paint sold for cyanide work.

The "pointed boxes" and other similar appliances used in the concentration mill are made in a similar manner with expanded metal, or rods and wire, and may be relied upon to give better service than either

REINFORCED-CONCRETE CYANIDE VAT, PACHUCA PATTERN.

wooden or iron apparatus. For dressing ores, concrete made with a smooth finish of neat cement offers an excellent surface to which some minerals appear to cling more than others. I had in use in Arizona two revolving "buddles" of 12 feet diameter made in this manner. The ore there consisted of several minerals, among them a copper-gold-silver mineral, valuable, and a zinc-sulphide, valueless. In passing the crushed ore over the buddles for washing off the rock matter, it was noted that the proportion of zinc sulphide gotten rid of

on these machines was greater than in any of the other appliances in the mill.

Trestles for the ordinary mine tramway are very striking instances of the advantage of reinforced concrete, especially in districts where timber has to be transported great distances. The difficulty and expense of carrying long timbers for the chords is enormous as compared with the carrying of cement, and the differences become more and more evident as the distance increases, and finally the timber becomes prohibitive when mule-back is the only means of transportation. Only about 15 per cent. of the bulk of concrete consists of cement to be transported; the balance, gravel or crushed rock and sand, ought to be obtainable at any mine without any further expense than gathering it up

on the spot. Attention is called to the advantage of designing these light bridges or trestles so that the whole structure forms a jointless, continuous, trussed girder, and with a view to making them self-supporting in the event of one or more of the legs being washed out from under by floods. It is only necessary to reinforce those parts subject to stresses of tension and shearing, the thin material usually employed for reinforcement being of little or no help against compression. To sustain the ordinary mine track using a car moved by man power, supports 16 feet apart, and chords 6 inches by 8 inches, are ample. Forms for this class of small repetition work are most conveniently made of No. 16 sheet iron nailed to a framework of 2 by 4 scantlings.

## Riviere de Loup Goldfields—Townships of Jersey and Liniere, Beauce County, Quebec.

Notes and Extracts from a Special Report by Dr. Henry Youle Hind, M.A., F.R.G.S., Published in the Year 1864.

Written for the Canadian Mining Journal.

(Continued from Page 619.)

(c) **The boulders in the bed** of the du Loup are principally upper Silurian clay slates of local origin. Occasionally slatey and quartz-like conglomerates are met with, as well as fragments of serpentinite. Both of these conglomerates, which belong to the Quebec group, were observed on place twenty-four miles north of the spot where the boulders were seen in the bed of the du Loup. A few boulders of syenite gneiss and epidosite were also recognized associated with those already described. These facts show that drift, not only from the Quebec group of rocks, which is known to be auriferous, has come from the north, and been distributed over the valley of the du Loup, but also boulders from the Laurentian series which lies to the north of the River St. Lawrence, distant some sixty miles in an air line. Fragments and rough masses of quartz, probably derived from the Quebec groups are also numerous in the bed of the stream. The importance of this supposition will appear when the source of the gold in the valley of the Riviere du Loup is discussed.

(d) **The Drift, Clays, Gravels, and Sands** of the valley of the du Loup and its tributaries may be classified as glacial drift and the remodelled drift. The alluvial flats in the river banks are derived from these older deposits and the wearing away of the rocks in the beds of the streams.

The glacial drift is represented by the unstratified blue clay with its associated boulders of northern origin. This drift must not be confounded with the stratified blue clay occasionally found in the bed on the alluvial banks of the Riviere du Loup. The glacial drift is capped by beds of gravel, gravelly clay, and stratified sand, which constitute the remodelled drift. Fine and coarse sand beautifully stratified was found forming mounds on the east side of the Riviere du Loup one hundred and fifty feet above its present level. The average thickness of the drift probably does not exceed

fifteen or twenty feet, however these different drift deposits may have been produced, it is enough for present purposes to know that both contain materials not only of local origin but also a considerable proportion of foreign detritus of northern origin; susceptible of being identified with rocks in position lying from 24 to 60 or 70 miles north of the area where they are now found.

### 111. The Gold of the Riviere du Loup and its Tributaries.

In this section Dr. Hind gives the results of numerous panning and cradling experiments conducted to determine "the auriferous, or non-auriferous, character of the rocks in position, as well as of the overlying drift." Good colours, occasional nuggets, and flakes resulted from many of the pannings, especially on the du Loup.

In Section IV., Dr. Hind attempts a rough estimate of the value of the drift and concludes that the plateau of the du Loup, containing about 3 grains of gold to each bushel of earth, could be worked hydraulically with profit. Dr. Hind's basis of calculation is a citation from the 1863 geology of Canada. He quotes Mr. W. P. Blake who, in a report on the gold fields of Georgia states that earth containing one twenty-fifth of a grain of gold to the bushel can be worked profitably by the hydraulic method. As the du Loup ground was estimated to contain 3 grains to the bushel, there appeared to be an ample margin of profit. Dr. Hind's estimate thus works out at about \$2.50 per cubic yard.

In Section V., "Origin of the Gold," Dr. Hind discusses further the source of the metal. He concludes that the auriferous drift clays and gravels of the Riviere du Loup really enclose the products of two distinct series of gold-bearing rocks, the upper Silurian slates and the lower Silurian schists, represented on the

Chaudiere, north of a few miles above the Guillaume River, in the parish of St. Franeis, by the Quebec group.

**The Black Sand**, Section VI., exists in considerable quantity in the gravels, clays, and alluvial deposits. According to Dr. Sterry Hunt, who examined this material at different times, it is made up of magnetite, hematite, chromic iron and ilmenite, with occasional grains of garnet nitile and, more rarely, zircon and corundum. Portions of native platinum and iridosmine were also obtained. Dr. Hunt recommends that the black should be saved for further treatment for gold not recoverable by washing.

Five specific advantages in working the gold-yielding Riviere du Loup tract are enumerated in Dr. Hind's Conclusion, Section VII.:

1. Uniform distribution of the gold in the drift clays and gravels in the valleys and in the uplands.

2. The occurrence of rapid streams with abundance of water for sluicing, fluming, or power, throughout the entire area under review.

3. The existence of numerous gold-bearing quartz veins, which can be worked during the entire year.

4. The comparative shallowness of the drift on the uplands which will admit of the clay slates being easily reached, where the course of heavy gold will most probably be found in the fissures of the slates exposed.

5. The facility with which the Metgermette, the small streams flowing into the Riviere du Loup, and the du Loup itself, can be diverted from their channels, and the present beds of these rivers exposed and worked. The beds of these rivers may be regarded as sluices on a gigantic scale which have been engaged in the operation of separating the gold from the drift for ages, and which have treasured up the products of their labour in the beds where they now flow, the gold being caught by the numerous reefs of slates which stretch across the river and thus protected from attrition.

## NOTES ON GOLD DISCOVERIES IN WHITNEY AND TISDALE TOWNSHIPS.

Report by Inspector James M. Bartlett, 15th October, 1909.

Whitney and Tisdale townships are reached from the T. & N. O. Ry., by leaving the train at mileage 228 1-2 which point has been made a flag-station, and named "Red Pine Lakes." The canoe-route from here to Porcupine Lake, which is situated conveniently to the gold-bearing area, is estimated to be in the neighbourhood of sixty miles in length, and is for the most part easy travelling. A fifty chain portage leads from the railway to a small lake from the south end of which a crooked creek drains into the Frederiek House River. The latter stream is ascended through the lake of the same name to Night-Hawk Lake, and the remainder of the journey is via Porcupine River to Porcupine Lake. Two portages—one of three chains and one of eight chains—occur on the Porcupine.

Eight days were spent in this vicinity and the twenty-four square miles bounded by the line shown on the map were travelled over and all the reported discoveries of gold visited. The location of these is shown on the map by the letter "G."

The area to the north and west of Porcupine Lake is a low-lying one consisting of a level plain, largely swamp-covered, with occasional outcrops of rock. The latter seldom rise to a height of more than ten or twenty

feet—as a rule being only four or five feet above the surrounding plain. The rocks of this area strike in a north-easterly direction and commonly weather with what might be described as a saw-tooth effect caused by the development of two planes of weakness, the one dipping at a high angle to the northwest and the other at a much lower angle to the southwest. The rocks of this section are much altered and some of the veins occur in a rock which approaches a quartz-schist. Besides this type rocks of a basic and others of a calcareous type occur.

In Concessions 1 and 2, especially towards the more southerly part, the country is higher and more rock is exposed, but only a few cases were seen where the hills rise as high as forty feet. In this section the schistosity is much more marked than in the northern area—ehloritic and hornblende schists being developed. One outcrop was found of a massive rock, which from the development of serpentine would lead one to suspect that it might have originated from an olivine-bearing rock.

The claims on which gold was seen are as follows: N.W.  $\frac{1}{4}$ , S.  $\frac{1}{2}$  Lot 1, Con. 5, Tisdale—Robert Bruce.

This discovery consists of a series of parallel veins of milky quartz, striking S. 83° E., and varying in width from one to eighteen inches. These had been stripped for about twenty-five feet and at one point on the contact of one of the veins with the country rock, gold is visible in grains and in leaf-like forms.

N.E.  $\frac{1}{4}$ , S.  $\frac{1}{2}$  Lot 2, Con. 5, Tisdale—W. H. Reamsbottom.

A few specks of gold are to be seen in two irregular bands of quartz from two to three inches wide and dipping to the south at a low angle (almost horizontal).

S.W.  $\frac{1}{4}$ , S.  $\frac{1}{2}$ , Lot 11, Con. 5, Whitney—A. E. Way (known as the "Bannerman" claim).

A vein of quartz on this property has been stripped at intervals for about three chains; strike east and west. Near the western end of the trenching it is about two feet wide, but about one chain to the east of here it is broken up into five parallel bands from three to twelve inches in width separated by about six inches of country rock. Dip is not determinable. Gold is visible in two places on this vein.

S.W.  $\frac{1}{4}$ , S.  $\frac{1}{2}$  Lot 2, Con. 5, Tisdale—W. H. Davidson.

Gold has been found at several points on a vein striking S. 85° E., with a dip to the south. The rock is much disturbed here and the vein, so far as could be seen with the small amount of stripping, consists of a series of irregular lenses of quartz.

N.W.  $\frac{1}{4}$ , N.  $\frac{1}{2}$  Lot 4, Con. 1, Tisdale—F. C. Remington (locally known as the "Wilson" property).

The largest body of quartz seen in the district occurs on this property associated with a much decomposed green schist. This vein had been found only a few days before, so that no work had been done on it, but it could be traced for at least six chains in a south-westerly direction, and at one point it appeared to be two chains in width.

Gold could be seen at five or six different spots near the northern end of this outcrop and one of these showings was the most attractive in the district. Enough gold not in the leaf form but rather resembling nuggets, was scattered through the quartz in a space of about an inch and a half square to cover a twenty-five cent piece.

The quartz in this vein, as in all the others mentioned above, is of the milky variety and is practically free from sulphides. No sinking has been done on any of

these properties and very little trenching. In view of this any estimates of "ore-in-sight" at the present time are unwarranted.

Since returning from this field another discovery has been reported occurring in the southwestern part of Tisdale Township.

(Signed)

JAMES BARTLETT.

### GOLD AND SILVER PRODUCTION IN CALIFORNIA

The mining interests of the State are wondering why the annual statistics of gold and silver production of California for 1908 have not been made public. Some time since the State Mining Bureau issued figures of production for all other mineral substances, and many requests have since been made to State Mineralogist Aubrey to supply those of the precious metals, but that official, in an interview, stated that the State Mining Bureau never did collect the figures of precious metal production, principally for the reason that the Government, through the United States Mint, was in a better position to obtain the figures than a State institution.

Besides, as the Government annually collected the statistics, it would place an unnecessary expense upon the State. When the statistics were collected by the Mint they were issued to the public, about the first of July of each year for the preceding year.

About three years ago, the Mint turned the work over to the United States Geological Survey, and since that time the Survey has supplied the statistics. It appears, however, that instead of the Survey improving on the system of the U.S. Mint, each year the statistics are longer delayed. Whether this should be charged to incompetency or carelessness is not known.

California is probably more vitally interested in the figures of gold production than any other State excepting Colorado, and the withholding of the statistics from the press of this State is inexplicable. At the same time the delay in furnishing the figures will make them of practically little value when they are given out.

The State Mining Bureau completed its statistics for 1908 in July, for over forty-five different mineral substances; yet it has taken the U.S. Geological Survey over ten months to collect figures on two mineral substances and they are not yet ready for the press, and California suffers from the delay in not being able to show to the world the large output of precious metals of our mines and thus invite the co-operation of capital.

## A Descriptive Sketch of the Geology and Economic Minerals of Canada.

By Dr. G. A. Young.

Published by the Geological Survey Branch, Department of Mines, Ottawa.

This latest publication of the Geological Survey is designed to furnish a readable, and reasonably complete, description of the geology and economic minerals of Canada. So vast a field needs careful approach. It is by no means easy even to draft a workable plan for an undertaking of this kind. But the need is more than apparent. To the great mass of people interested in some phase of mining, the special reports of geologists are either too vague or too abstruse, or both. In any case, the effort to consolidate in one volume the cream of the geologic, mineralogic and physiographic data gathered by the Survey is commendable. It supplies the public with what is wanted in concise form.

Dr. J. A. Young, the compiler of the volume, has adapted broadly the plan followed by the late Dr. J. M. Dawson in his admirable outline of the physical geography and geology of Canada, prepared in 1897, for the Toronto meeting of the British Association for the Advancement of Science. Since that time our knowledge of the geology of Canada has been added to largely. Consequently Dr. Young's basis is wider and better-defined than was Dr. Dawson's.

Director Brock's lucid introduction is followed by a few prefatory and explanatory pages by Dr. Young. Then each of the geologic provinces, enumerated herewith, is dealt with. Political divisions are disregarded, except for reference.

Dr. Young's provinces are as follows:—

1. **The Appalachian Region**, including the portion of Canada east of a line running from Lake Champlain

to the neighbourhood of the city of Quebec and thence down the channel of the St. Lawrence.

2. **The St. Lawrence Lowlands**, including the plain bordering the St. Lawrence River above the city of Quebec and extending through southern Ontario to Lake Huron.

3. **The Laurentian Plateau Region**, including the great U-shaped upland surrounding Hudson Bay.

4. **The Arctic Archipelago**, including the islands of the Arctic Ocean north of Hudson Bay.

5. **The Interior Continental Plain**, including the central belt of plains lying between the western margin of the Laurentian plateau and the Rocky Mountains.

6. **The Cordilleran Region**, including the mountainous region of the western portion of the continent.

To each of these divisions one chapter is assigned. The geology of each is outlined, and the economic mineral occurrences of each are described at more or less length.

A concluding chapter touches on the phenomena of the glacial period. Two maps are appended, a second of the excellent "Minerals" map, and a general geological map of the Dominion.

### Abstract of Director Brock's Introduction.

Mr. R. W. Brock, Director of the Geological Survey, in his introduction disarms critics. "In a brief and general statement," he explains, "concerning so wide a subject, and covering so vast a territory, much that is interesting and important must of necessity be

passed without notice; and the broad generalizations cannot be expected to present with absolute fidelity the actual facts. What has been attempted is to give merely a general idea of the conditions obtaining in the various geological provinces into which the Dominion of Canada is naturally subdivided, together with the more important minerals which are characteristic of, or which have been exploited in, each."

The geological investigation of Canada may be said to have been commenced in 1843, with the organization of the Geological Survey of Canada, under Sir William Logan. The work of Logan and of his assistants, Murray, Hunt, Billings, and others, was summarized in a volume published in 1863, "The Geology of Canada." This deals only with the southern portions of the Provinces of Ontario and Quebec. The work of the Geological Survey embraces now the northern half of the continent of North America. In spite of enormous difficulties, sufficient work has been done to make known Canada's main geological features; to indicate roughly the territories that will be found to be mineral-bearing; to forecast the character of its mineral resources in the different mineral provinces; and to demonstrate that Canada is destined to become one of the great mining countries of the world. Nevertheless, a large part of Canada is yet unexplored.

The amount of mineral-bearing territory still awaiting the prospector is prodigious, the greatest, in fact, that now remains anywhere on the globe.

The tardiness in developing the mineral resources is due probably to Canada's wealth in farming lands. The first settlers, in order to provide food were forced to become farmers. Farming lands were sought after, and were developed by lines of transportation. The lack of transportation facilities in the mineral-bearing areas, and the extent of country in proportion to its population were contributory factors.

In 1886, the mineral production of Canada did not reach \$10,250,000 in value, and was only \$2.23 per capita. In 1908, the production was \$87,000,000, or \$12.57 per capita. The output of the mine is now greater than the combined output of forest and sea, and ranks next to agriculture.

The total production of minerals for the last twenty-three years amounts to \$926,516,579, of which gold represents \$267,700,000.

In the review of the world's production in 1907, Canada ranked first in asbestos and nickel; third in chromite; fourth in silver; seventh in copper; eighth in gold; and tenth in coal.

Mr. Brock notes the geographical distribution of the chief commercially important minerals, and notes the mineral possibilities of the geological provinces.

**The Appalachian Region** is characterized by rock formations that are typically disturbed and thrown into a succession of folds. In Canada, the Appalachian extension is found to possess many of the minerals that have placed some of the eastern States in the foremost rank of mineral and industrial districts of the world.

Comparing Pennsylvania, which is probably the best developed Appalachian State, with Nova Scotia, Mr. Brock points out that whereas Pennsylvania has an annual production of domestic minerals approximately equal to \$9,340 per square mile of territory, or to \$67 per capita, Nova Scotia has an annual production of about \$1,000 per square mile, or \$46.00 per capita. Taking into consideration the more intensive production that follows increase of population, a geological comparison would appear to be fair, and Nova

Scotia would seem to possess proportionately equal mineral resources with the most favoured Appalachian States. The mineral development of New Brunswick is backward. This is partly due to the heavy covering of soil, and to the forested areas. Many important mineral deposits have been found, and a few are being worked to advantage. The south-eastern portion of Quebec—also belonging to the Appalachian area—is a high producer of economic minerals. The main asbestos mines of the world are situated in this area; and important industries are carried on in chrome iron ore, copper and pyrites.

**The Lowlands of the St. Lawrence Valley**, including the southern portion of Ontario, consist mainly of flat-lying Palaeozoic rocks. The mineral products are typically clay, cement, petroleum, natural gas, gypsum, and other non-metallic products.

**The Laurentian Plateau** is described by Mr. Brock as an area of pre-Cambrian rocks, estimated to cover 2,000,000 square miles, or over one-half of Canada, lying north of the Valley of the St. Lawrence, from Newfoundland to beyond Lake of the Woods, and enclosing Hudson Bay like a huge V. Only the southern fringe of this area is known, and of this fringe only a portion prospected. These rocks are remarkable for the variety of useful and valuable minerals they contain. The Michigan copper mines, the Lake Superior iron ranges, the Thunder Bay silver region; the Sudbury copper-nickel deposits; the Cobalt silver areas; the magnetite and mica deposits of eastern Ontario and Quebec fall within this geological province. Mr. Brock refers to the fortuitous manner in which most of the richest mineral districts were discovered, and to the unsuspected possibilities of this great stretch of 2,000,000 square miles.

**The Interior Plain** embraces the greater portions of Manitoba and Saskatchewan which lie outside the pre-Cambrian, and the Province of Alberta. This area is pre-eminently agricultural, but in addition to furnishing a market for the product of the mines, it will have a large output of non-metallic minerals. It is underlain mostly by sedimentary rocks, chiefly of Cretaceous age, containing coal, building stones, clays, and cement materials. Natural gas has been tapped over wide areas and under great pressure, and there is every indication of a large oil field in the northern portion, at least, of Alberta, and some oil has been encountered in the south-west. The tar sands of the Cretaceous, along the Athabaska River will be important sources of asphaltum. The lignites of the eastern plains and the bituminous coals to the west occupy known areas comprising at least an extent of 27,330 square miles. Alluvial gold, clay-ironstone, salt, and gypsum also occur.

**The Cordilleran Belt**, in South America, in Mexico, and in the Western States, is recognized as one of the greatest mining regions in the world. It is noted principally for its wealth of gold, silver, copper, and lead. The Cordilleras stand unparalleled for the continuity, extent, and variety of their mineral resources. In Canada, and in Alaska, this belt maintains its reputation; although in both it is for the greater part unprospected. In Canada its length is 1,300 miles, and its width 400 miles. Pre-eminently a great mining region, its rocks range from the oldest formation to the youngest. Vulcanism and mountain building have repeatedly been active. Although developed along the international boundary line, probably not one-fifth is prospected at all; not one twentieth prospected in detail; and not one area, however small, completely tested.

Fifteen years ago lode mining commenced in British Columbia, the production before this being largely in placer gold and coal. In 1893, the annual production of minerals in British Columbia had a value of about \$3,500,000. It now runs about \$25,000,000. The total production, up to the end of 1907, was about \$300,000,000. The Yukon is credited with over \$125,000,000 in placer gold.

The Cordilleran belt in Canada is rich also in coal of excellent quality, ranging from lignites to anthracite, and conveniently distributed. Only the coal areas in the southern portion of the Province, and a few small areas on the Telkwa and Nass Rivers, and on the Yukon, are known at present. But the estimated quantity of coal in these known fields is enormous. British Columbia's known coal fields, according to Mr. D. B. Dowling's estimate, comprise 1,123 square miles, containing 20 million tons anthracite, 38 billion tons

bituminous, and 314 million tons lignite. The corresponding figures for the Yukon are: 400 square miles, estimated to contain 32 million tons anthracite, 32 million tons bituminous, and 850 million tons lignite.

The prospective resources of the Cordilleran belt in Canada are enormous. Though mostly unprospected, it has already been proved to possess the greatest copper mines; one of the greatest silver-lead mines; and two of the greatest placer camps in Western America—a region noted for its extraordinary mineral wealth.

Perhaps half the rock history of the world is written in the pre-Cambrian, and it is of this portion that most remains to be deciphered. Since the greatest spread of these old rocks occurs in Canada, much of this work will fall to Canadian geologists, and the careful solution of the problems presented will be as valuable to science as to the mining industry.

## CANADIAN AND ENGLISH COMPANY LAW.

On September 1st, the *Financial Times*, of London, published a letter, in which comparison was made between Canadian and English company law. The comparison did not result favourably to Canada.

Mr. J. J. Harpell, who is at present in England, sent the following communication to the *Financial Times* early in October. A copy was also mailed to the Canadian Mining Journal for simultaneous publication.

For clearness' sake we append the original letter that appeared in the *Financial Times*.

We may remark that if our English contemporaries took ordinary pains to ascertain facts concerning Canada, they would have much less to complain of:—

(From the *Financial Times*, Oct. 23, 1909.)

### Canadian Company Law—How It Differs From English Legislation—Some Objectionable Features.

It seems desirable to sound a note of warning to investors in regard to some of these companies, which the lax state of the Canadian company laws permits to be greatly over-capitalized. The Canadian company laws follow the American rather than the English model, being in this respect unlike the Australian and New Zealand Companies Acts, which are framed upon the English Acts from 1862 to the present date.

A Canadian company may be incorporated under a Dominion charter, or by a charter granted by any one of the nine Provinces. Except in certain special circumstances, as in the case of railways, a Provincial charter seems to be just as good as a Dominion one. Charters for new companies are obtained at a ridiculously low cost, from an English standpoint, the scale of fees being similar to that charged by some of the American States, that have the unenviable reputation of being the "domiciles" of many of the questionable undertakings with which the United States is flooded. In the promotion of a Canadian company the laws make no provision for proper disclosure of agreements by which hidden profits may be secured, and in a majority of incorporated companies there seems to be little doubt that the vendors or promoters make enormous undisclosed profits. There is not in Canada such a place as Somerset House, where a shareholder

can satisfy himself about the main features of the company in which he happens to be interested, or a creditor can see a list of shareholders. The shareholder in a Canadian company knows just as much about its affairs as he can gather on the outside, or as the Directors, collectively or individually, choose to tell him.

### Directors' Idea of Duty.

Canadians have not yet come to realize that a company, when it is incorporated, becomes an entity recognized by law as such, just as much as any individual human being. Canadian, like American, directors do not as a rule recognize that they are trustees for the shareholders—not only for the owners of a majority of the share capital, but for every individual shareholder. Hence it follows that a Canadian director usually finds it his duty and to his advantage to administer the company solely in the interest of the person or persons holding the "controlling interest." It is customary for promoters to make presents of shares for a qualification to directors, who are thus in the pay of persons whose interests are frequently antagonistic to a minority of the proprietors after the company has come into operation. A respectable and responsible Englishman to-day will not lightly, or until after due consideration, allow his name to appear on the prospectus of a new company. It is far otherwise in Canada, and it would be easy to mention names of a number of men well known not only in Canada, but also in this country, who figure on the directorates of all sorts of companies, as to the proceedings of which they know little or nothing—and probably care less.

### Share Capital Regarded as "Boodle."

The method adopted in the formation of a Canadian company is simple. The stock or share capital is from the start regarded as so much "water," or "boodle." Take the case of a company incorporated for, say, \$30,000,000, of which \$15,000,000 is in five per cent. gold bonds, "payable principal and interest, in London, Montreal or New York," and the remaining \$15,000,000 in fully-paid shares, the whole amount of capital required to carry out the purposes of the undertaking being not more than \$10,000,000. The first thing to do is

to advertise the company and start selling some of the bonds. Blocks of bonds are hawked round for, perhaps, 60 cents on the dollar of their face value, but the purchaser, or the selling agent, for his services receives a large number of shares by way of a bonus on the sale of the bonds. It is customary, as a Toronto man puts it, in the formation of a company, "to give a good swag of shares to the boys and let them go around gassing it up." There is no doubt that this frequently occurs. It would be very interesting if a return could be prepared showing what actual cash was received in exchange for the issue of their shares by a selected list of, say, two hundred companies of Canadian incorporation. There is no law prohibiting the issue of shares at a discount, and, in fact, nearly all the safeguards that the English laws provide for the safety and security of the investing shareholder are conspicuous by their absence from the Dominion and Provincial legal codes.

#### Loose Administration.

Time and again there has been talk of a revision of the Canadian company laws, with a view to bringing them into closer correspondence with the laws in force in England. Vested interests have probably proved too strong, for the proposed amendment has been shelved every time it has been suggested. Nearly every member of the Dominion Parliament and of the Provincial Legislative Assemblies is a director of one or more companies, which, to some extent, may account for the company laws being allowed to remain in their present lax condition. It is far from being my wish or intention to in any way reflect upon or disparage Canadian business men, but, with some experience of the subject, I have no hesitation in saying that the business methods and commercial morality of Canadians are patterned upon the standard of the United States rather than upon the customs of Great Britain—and in no branch of commercial life is this dissimilarity to the Mother Country so apparent as in the loose administration permitted to, and practised by, directors of companies of Canadian incorporation. From the foregoing criticism, the Canadian banks are exempted, as the banking laws are quite distinct from the company laws and are rigidly enforced by the Dominion Government.

In Canadian mining companies, often formed to work mere prospect holes, and sometimes absolutely unexplored mining leases, the over-capitalization is ludicrous and pitiful. Pitiful, because many ignorant and innocent people are smitten with "mining fever," and rush in, to their undoing. But in the matter of over-capitalization some of the principal industrial undertakings are about as bad as the mining propositions. In particular, some of the numerous electric power companies might be instanced. Their over-capitalization is nothing short of a public calamity. They carry a huge deadweight of watered stock, upon which the consumer has, for all time, to pay enough for his power to earn dividends. Where the shares of such concerns have passed by transfer into the hands of second and third parties, it would be hard on these innocent holders if laws are passed compelling companies to furnish power at a rate that will pay liberal interest only on the actual capital expended, or, if the State should expropriate some of these power concerns on a valuation arrived at in the same way. This aspect of the case is not imaginary, as there is a strong and growing feeling in many parts of Canada that electricity is now so much of a necessity in everyday life that its generation should be controlled by the State, and that its cost should not be enhanced to the consumer by having to pay dividends

on large amounts of watered capital, for which no cash ever found its way into the treasury of the power companies.

#### Canadian Directors and English Companies.

There has been some newspaper talk of late of the advisability of securing Canadian directors for English companies doing business in the Dominion. It looks well on paper, but it would not, in all probability, turn out well in practice. To begin with, a Canadian of any standing would be unlikely to buy into any English company at current prices to secure a qualification and sufficient interest in a company to become a director. He comes to England to sell, and not to buy, shares, as a rule. A carefully selected, and numerically small, Canadian Board of Advice to co-operate with an English Board of Directors is quite another matter and in many cases might be distinctly advantageous, so long as the control of the purse strings is retained in the hands of those who have to find the money in England. As a rule, however, one strong man of the right sort, with a competent knowledge of his work and on the ground, is worth half-a-dozen Canadian Boards of Advice, if he enjoys the entire confidence of his directors and they give him a free hand in everything except the financial policy of the company.

#### An Instructive Story.

As to the names that figure on the directorates of Canadian companies, the following little story is instructive. A heavily capitalized Canadian company has for some years been unloading its shares in the United Kingdom—or rather it should be said that the promoters and their associates have been unloading their shares on British investors. On the Canadian directorate are some of the best-known names in the business and financial world of the Dominion. English newspapers from time to time have made favourable comment on the strength of the Canadian Board. One of the gentlemen mentioned as a director—a very well-known man—a short time ago visited England, and to him went a seeker for information about the Canadian company. "Why do you come to me?" asked the Canadian magnate. "Because you are one of the directors," was the reply. "Am I?" said the Canadian, "well, I suppose the company is all right, but, to tell you the truth, I didn't know I was connected with it. 'They' put me down on it when the concern first came out, but I've never taken any active interest in it. I suppose I've got some stock in it—must see about it when I get back to the other side." It will be noticed that the Canadian magnate said "they" put him on the directorate. By "they" he presumably meant the promoters. "They" did not put him there for nothing, for many English investors regard his name as a tower of strength as a typically successful Canadian. The moral of the whole of the foregoing is that intending British investors in companies of Canadian incorporation—especially of recent incorporation—should make strict inquiry into the original issue of the capital stock of the company—who got it, and what money was paid to the company, not the promoters, for it.

#### Mr. Harpell's Letter.

To the Editor of the Financial Times:

Sir,—In your issue of September 1st, there appeared an article by one of your correspondents entitled "Canadian Company Law," in which much injustice is done

to Canadian people and to many of their laws and institutions. It would be a great mistake to leave your readers under the impression that Canadian Company Law has not been modelled after similar English legislation, because nothing could be further from the truth. The Dominion Companies Act and that of every Canadian Province, with the exception of Ontario, is similar to the company law of England as it was previous to 1901, while the Act of Ontario is almost an exact replica of the English Act of 1901, with one or two very important amendments, the principal one being that the Ontario Act requires that all foreign companies attempting to market their securities in the Province must file information equally complete and exhaustive as is required of companies chartered by the Province. In this respect the Ontario Act does much more to protect its people from fraudulent flotations chartered by foreign countries than does the English Act.

Within the last few days my attention has been drawn to literature that is being circulated in the United Kingdom by a company chartered in United States to float mining claims of the Cobalt district of Canada. This flotation has made no registration at Somerset House, and its promoters seem to be going about their business of unloading their scrip upon the English people without any interference. This is in marked contrast to the manner in which this same company was treated when an attempt was made to dispose of its securities in the Province of Ontario. As soon as its promoters started to circulate their literature in that Province, they were proceeded against, under instructions from the Government, fined the maximum penalty imposed by the Companies Act, and compelled to withdraw their literature.

When your correspondent says that "there is not in Canada such a place as Somerset House, where a shareholder can satisfy himself about the main features of the company in which he happens to be interested," he certainly shows himself to be not very familiar with his subject. In the Provincial Secretary's Department at Toronto he will get as much information concerning any company chartered either by the Province of Ontario, or which, chartered elsewhere, attempts to sell its stock or bonds in Ontario, as he will get at Somerset House concerning any company registered there. Furthermore, neglect on the part of any company to register the required information is a much more serious oversight in Ontario than it seems to be in England. During the last few years very many promotions of a questionable character have been brought to grief for neglecting to register in the Provincial Secretary's Department the information required by the Ontario Companies Act.

The observation of your correspondent that the over-capitalization of the numerous Canadian electrical power companies is "nothing short of a public calamity" is well made. "The huge dead weight of watered stock" upon which dividends are to be earned is a heavy burden on the industries that are compelled to use their power. But this is not true only of electrical power. Almost every conceivable commodity in Canada is being syndicated and capitalized to an extent that is forcing up the cost of living and production to a point where the prosperity and development of the country are being threatened. The people are already aroused by this fact, and are taking steps to protect themselves which would never have been contemplated under ordinary conditions.

The recently-adopted policy of the Ontario Government to assist a number of municipalities to procure electrical power at reasonable rates is the direct result of an attempt on the part of a few reckless promoters

to compel the people to use their power at prices that would enable them to pay handsome dividends on an enormous amount of watered stock. It is very much to be regretted that so many English papers should have seen fit to denounce this move and to attempt to make it difficult for the Province to raise money for this purpose. These papers should have realized that a policy which had the support of a whole people, so nearly approaching unanimity, must have been actuated by an intolerable condition of affairs. The money which the English people, by subscribing to the recent Ontario bond issue, have provided for the carrying out of the power policy of Ontario means much for Canada, and will do more to build up a healthy sentiment than many times the same amount that has been given for the securities of Canadian syndicates and other private corporations has done.

It will be really too bad if English investors, who have taken up the securities of private Canadian corporations, suffer any loss by the policy of municipalization and nationalization of necessities, which the people of Canada are being forced to adopt. But surely if such should be the case, less blame attaches to the people of Canada than to the judgment of the investors or to English laws, which should have compelled promoters to file particulars of these private corporations at Somerset House, where it would have been seen that the actual investment of these companies represented but a very small fraction of the capitalization, and that the methods of the promoters were, to use your correspondent's words, "to give a good swag of shares to the boys and let them go around gassing it up."

It is very interesting to review some of the tactics by which promoters of these private corporations endeavour to unload their securities in this country and in Canada. In England the people are urged to take up the securities because they represent a Canadian enterprise and by so doing they will be building up the Empire. In Canada the Englishman's subscription is held up as an example and pointed to as a guarantee that the flotation is "a good thing."

I am, etc.,

J. J. HARPELL.

#### ROUMANIAN PETROLEUM.

The growth of the petroleum industry of Roumania has been phenomenal. Twelve years ago, 1897, the annual output of crude oil was 110,000 tons. Last year, 1908, the output was 1,147,000 tons. Nearly all of this production has come from old fields, and much good territory remains to be exploited.

Ninety-five per cent. of the present production comes from three districts—Campina-Bustenari, Baicoi-Tzin-tea, and Gura-Oenitza-Moreni. The two former fields were worked for years by means of the old hand-dug wells.

From the Campina-Bustenari zone comes over 60 per cent. of the total output. It is, therefore, the centre of the industry. More than 50 per cent. of the wells drilled in this region were gushers, often producing hundreds of tons per day when first drilled. Much of the district is held by speculators and development thus retarded.

In the Gura-Oenitza-Moreni field there was only one productive borehole in 1904. There are now sixty.

The English Companies Act forbids the distribution as dividends of money earned prior to the actual flotation of a company.

## LIST OF PERMISSIBLE EXPLOSIVES.

Tested Prior to October 1, 1909.

The following list of permissible explosives tested by the United States Geological Survey at Pittsburg, Pa., is hereby published for the benefit of operators, mine owners, mine inspectors, miners, and others interested.

The conditions and test requirements described in Explosives Circular No. 1, issued under date of May 15, 1909, have been followed in all subsequent tests.

Subject to the provisions named below, a permissible explosive is defined as an explosive which is in such condition that the chemical and physical tests do not show any unfavourable results; which has passed gas and dust gallery tests Nos. 1 and 3, as described in Circular No. 1; and of which, in test No. 4, 1½ pounds (680 grams) has been fired into the mixture there described without causing ignition. (Those reported in Explosives Circular No. 1 are marked \*.)

| Brand.                     | Manufacturer.                                         |
|----------------------------|-------------------------------------------------------|
| *Ætna coal powder A.....   | Ætna Powder Co., Chicago, Ill.                        |
| Ætna coal powder AA....    | Do.                                                   |
| *Ætna coal powder B.....   | Do.                                                   |
| Ætna coal powder C.....    | Do.                                                   |
| Bituminite No. 1.....      | Jefferson Pdr. Co., Birmingham, Ala.                  |
| Black Diamond No. 3....    | Illinois Pdr. Mfg. Co., St. Louis, Mo.                |
| Black Diamond No. 4.....   | Do.                                                   |
| *Carbonite No. 1.....      | E. I. Du Pont de Nemours Powder Co., Wilmington, Del. |
| *Carbonite No. 2.....      | Do.                                                   |
| *Carbonite No. 3.....      | Do.                                                   |
| *Carbonite No. 1-L. F..... | Do.                                                   |
| *Carbonite No. 2-L. F..... | Do.                                                   |
| Coalite No. 1.....         | Potts Powder Co., New York City.                      |
| *Coalite No. 2-D.....      | Do.                                                   |
| *Coal special No. 1.....   | Keystone Pdr. Co., Emporium, Pa.                      |
| *Coal special No. 2.....   | Do.                                                   |
| *Collier dynamite No. 2... | Sinnamahoning Powder Mfg. Co., Emporium, Pa.          |
| *Collier dynamite No. 4... | Do.                                                   |
| *Collier dynamite No. 5... | Do.                                                   |
| Giant A low-flame dynamite | Giant Pdr. Co. (Con.), Giant, Cal.                    |
| Giant B low-flame dynamite | Do.                                                   |
| Giant C low-flame dynamite | Do.                                                   |
| *Masurite M. L. F.....     | Masurite Explosives Co., Sharon, Pa.                  |
| *Meteor dynamite .....     | E. I. Du Pont de Nemours Powder Co., Wilmington, Del. |
| *Mine-ite A .....          | Barton Powder Co., Pittsburg, Pa.                     |
| Mine-ite B .....           | Do.                                                   |
| *Monobel .....             | E. I. Du Pont de Nemours Powder Co., Wilmington, Del. |
| Tunnelite No. 5.....       | G. R. McAbee Powder and Oil Co., Pittsburg, Pa.       |
| Tunnelite No. 6.....       | Do.                                                   |
| Tunnelite No. 7.....       | Do.                                                   |
| Tunnelite No. 8.....       | Do.                                                   |

by other explosives will be made public immediately after the completion of the tests.

With a view to the wise use of these explosives it may be well in this connection to point out again certain differences between the permissible explosives as a class and the black powders now so generally used in coal mining, as follows:—

(a) With equal quantities of each, the flame of the black powder is more than three times as long and has a duration three thousand to more than four thousand times that of one of the permissible explosives; the rate of explosion also is slower.

(b) The permissible explosives are one and one-fourth to one and three-fourths times as strong, and are said, if properly used, to do twice the work of black powder in bringing down coal; hence only half the quantity need be used.

(c) With 1 pound of a permissible explosive or 2 pounds of black powder, the quantity of noxious gases given off from a shot averages approximately the same,

provided:

1. That the explosive is in all respects similar to sample submitted by the manufacturer for test.
2. That No. 6 detonators, preferably No. 6 electric detonators (double strength), are used of not less strength than 1 gram charge, consisting by weight of 4 parts of mercury fulminate and 10 parts of potassium chlorate (or its equivalent), except for the explosive "Masurite M. L. F.," for which the detonator shall be of not less strength than 1½ grams charge.
3. That the explosive, if frozen, shall be thoroughly thawed in a safe and suitable manner before use.
4. That the amount used in practice does not exceed 1½ pounds (680 grams), properly tamped.

The above partial list includes all the permissible explosives that have passed these tests prior to October 1, 1909. The announcement of the passing of like tests

the quantity from the black powder being less than from some of the permissible explosives and slightly greater than from others. The time elapsing after firing before the miner returns to the working face or fires another shot should not be less for permissible explosives than for black powder.

The use of permissible explosives should be considered as supplemental to and not as a substitute for other safety precautions in mines where gas or inflammable coal dust is present under conditions indicating danger. As stated above, they should be used with strong detonators, and the charge used in practice should not exceed 1½ pounds and in many cases need not exceed 1 pound.

JOSEPH A. HOLMES,

Expert in Charge Technologic Branch.

Approved, October 11, 1909.

## WINNIPEG MEETING OF BRITISH ASSOCIATION.

[EDITOR'S NOTE.—The following paragraphs were omitted from Mr. C. W. Knight's article in our last issue.]

The excursion and side trips taken by the party were many and varied. They visited the silver and nickel camps of Ontario, the Keewatin iron ranges at Temagami and Moose Mountain, and Silver Islet, that lone dot of land on the north shore of Lake Superior. While at Winnipeg trips were arranged to the quarries at Stoney Mountain, to modern flour mills and great railway yards, to prairie lands nearby where thrashing operations could be seen on a large scale, and, finally, a trip to the Pacific Coast, which was participated in by the officers and guests of the association.

The excursion to Cobalt and Sudbury was taken before the meeting at Winnipeg by about a score of members. The trip was arranged by Dr. W. G. Miller, and the party was conducted about Cobalt by Dr. Miller and Mr. Arthur A. Cole; while at Sudbury Mr. Turner, the president of the Canadian Copper Company, took charge of the visitors. The geology of Cobalt was explained by Dr. Miller in such a way that it seemed simplicity itself, and the wonder was that the Cobalt area should have remained so long a geological terra incognita. We were told that the oldest rocks in the camp were greenstones known as the Keewatin series; that these were penetrated by granites, now defined as Laurentian. For an enormous length of time these greenstones and granites were cut down and eroded by atmospheric agencies, and during this period the conglomerates, slates, and quartzites were deposited. After another long interval of time all the rocks previously mentioned were cut by great sheets or sills of diabase. As a remnant of one of these sills we were shown Diabase Mountain, to which, surely, every Cobalt mining promoter should daily take off his hat and make his very deepest bow, for has not this same diabase brought up from the depths of mother earth the silver and cobalt and nickel and given to the world a mining camp which is unique on a whole continent?

The widely advertised Lawson vein was studied with interest by the party because there has been little or no work done on the surface and a good idea was therefore obtained of the cracks in which the veins occur. By the genial Sam Cohen the party was shown through the underground workings of the Crown Reserve mine. Some of the methods of concentrating the ores were seen in operation at the Coniagas and other mills. One day was spent in a gasoline launch on Lake Temiskaming and different points of geological note were visited.

Much admired was the model by Arthur A. Cole, of Cobalt, constructed from the geological maps and reports of the area by Willet G. Miller, Provincial Geologist.

Cobalt was left behind early in the afternoon of August 19th, but a few hours were spent at Temagami to see the banded jasper iron ores there. If it is true that the world's known supply of high-grade iron ore may be exhausted in sixty years, these low-grade ores are destined to play an important part in the future of the iron industry.

While in the Sudbury district Mr. Turner personally conducted the members through the large metallurgical plant at Copper Cliff, and although during this process they were more or less choked by sulphur fumes this was soon forgotten over the delightful little luncheon given through his kindness. The same day the Creigh-

ton mine was visited, from which much of the nickel ore is obtained.

The geology of the district was explained by Prof. Coleman. He stated that, unlike Cobalt, no basement had as yet been found for the great series of sediments occurring there. At all places where they are in contact with igneous rocks the contact is an intrusive one. It has not been possible either, to prove the presence of the Keewatin series, though certain greenstones may represent this group.

A day was spent at the Moose Mountain iron mine, which lies to the north of the Sudbury district. Mr. Jordan, the manager, showed the party the various workings, and incidentally pointed out a pine tree which was climbed by a noted iron man from the United States. He was driven to this stern though rather ludicrous extremity—so the story goes—by a bull moose and to prove the truth of this yarn a photograph of the tree was shown.

## GAS-PRODUCER PROBLEMS.

The United States Geological Survey, through its Technologic branch, has just issued a bulletin entitled "Incidental Problems in Gas-Producer Tests," by R. D. Fernald, C. D. Smith, J. K. Clement and R. A. Grinnell. The Survey is studying the general problems involved in the economic use of fuels in gas-producers as part of its investigation of methods of increasing the efficiency of the fuel resources of the country. The bulletin declares that one of the important problems is the determination, under practically constant conditions, of the duration of gas-producer tests necessary to reduce the possible error to a minimum. A greater part of the bulletin is therefore taken up with a discussion of the proper length of test period.

Mr. Fernald, the consulting engineer in charge of these tests, has the following to say on this subject: "Some of the test results reported by certain gas-producer manufacturers are so absurd that no careful purchaser will be deceived; but, unfortunately, the alluring guarantees and special inducements regarding the cost of the installation have caught enough unwary buyers to injure seriously the business of reputable concern. It is not uncommon to pick up advertising material that states a fuel consumption per horsepower per hour based on tests of two or three hours' duration only, which the total coal charged during that period was from 20 to 30 pounds. The producers in such tests are of course of small sizes, but the principle is the same for all.

"The initial fuel bed built up before the test started amounts to several times the quantity of fuel charged during short interval tests, and the amount of gas that may be drawn from this foundation bed is an unknown quantity. It may be very small or may reach a large percentage of the total gas used during short tests, depending on the carelessness or cleverness of the superintendent of the test.

"Of course the claim is made that at the end of the test the fuel bed is always brought to the same condition that it was in the beginning, but experience in this direction need not be great to show that such conditions are practically impossible in tests of short duration. The error introduced by such an assumption may be sufficiently great to make the record results absurd. In fact the percentage of possible error, may be so large that it is only necessary to predetermine the desired fuel consumption per horse-power per hour and trust to it.

lever manipulation of the operator to secure that result.

"It is no wonder then that tests showing a consumption of only 0.6 pound of coal per horse power per hour are often reported; and apparently it is only necessary for some daring promoter to decide that a horsepower should be developed with a consumption of 0.25 pound per hour for tests to be reported that show this figure.

"For accurate tests of gas producers and for a true determination of the fuel consumption, either the condition of the fuel bed at the beginning and at the end of the test must be positively known, or the test must be of sufficient duration to practically eliminate the uncertainties that arise from varying conditions of the bed. Inasmuch as the first method is usually out of the question, it is necessary to resort to the second, at the same time securing as uniform conditions as possible in the fuel bed."

Mr. Fernald summarizes the tests as follows:

"That throughout a test the fuel bed should be maintained in uniform condition, with regard to both the character of the fire and the thickness of bed; but that failing in this, special care should be exercised to see that the fuel bed is in the same condition and of the same thickness at the close of a complete test, or at the end of a test period, as at the beginning; that a test should never be started when the producer has been standing idle for some time with 'banked fires,' as the fuel bed will not be in the average condition under which it will be required to work during the test; that, as the appointed hour for closing the test approaches, the fuel bed is not in proper condition, the time of closing the test should be postponed until the bed naturally assumes the proper thickness and character. No forcing of conditions should be allowed simply to bring the test to an end at a previously determined hour."

## TUNGSTEN.

One of the most widely known of the rarer metals is tungsten. The production of this metal in the United States, however, is not large, as a little of it goes a long way for some of its most important uses. As by far the largest of the tungsten produced is used in making tool steel, the demand for tungsten decreased greatly during the recent depression in the steel industry. In 1908 the domestic production of tungsten ore, reduced to an equivalent of ore carrying 60 per cent. of tungstic trioxide ( $WO_3$ ), the ordinary commercial basis is the United States, was 671 short tons, valued at \$229,955, as against 1,640 tons, valued at \$890,048, in 1907. The statistics at present available from foreign countries show a similar decline. These figures are taken from a report by A. L. Hess, of the United States Geological Survey, published in an advance chapter from "Mineral resources of the United States, calendar year 1908." Mr. Hess gives also details of the industry by States, notes on the occurrence and uses of tungsten, and a partial bibliography.

### Occurrence of Tungsten.

Tungsten is of wide occurrence, but the individual deposits can hardly be said to be large. As a rule they are "pockety"—that is, they occur in lenticular masses or small shoots. Many of those at the surface are quick and easily mined, but it may then take all the profits derived from the first ore body to locate another one.

The tungsten minerals used as ores are hubnerite, a tungstate of manganese; wolframite, a tungstate of manganese and iron; ferberite, a tungstate of iron; and scheelite, a tungstate of calcium. They generally occur in veins cutting igneous rocks that contain much silica, such as granite and granodiorite. Some simple tests for identifying these minerals are described by Mr. Hess.

### Uses of Tungsten.

The most important use of tungsten is as an alloy for tool steel, to which it imparts the property of holding temper at a much higher temperature than high-carbon steels. When lathe tools are made of tungsten steel the lathe may be speeded up until the chips leaving the tool are so hot that they turn blue. It is said that about five times as much work can be done by a lathe built for such speeds and work and fitted with tungsten-steel tools as can be done by the same lathe with carbon-steel tools. From 16 to 20 per cent. of tungsten is ordinarily used in lathe tools.

There has been a widespread belief that most of the tungsten mined went into armor plate, but it is stated by the Ordnance Bureau of the Navy Department that tungsten is not now and, so far as known to that bureau, never has been used in the manufacture of armor plate in this country, and it is not known to have been so used in other countries, though it has probably been used in experimental armor plates. One of the most essential properties of armor plate is its ability to resist shock, and this property is not imparted to steel by tungsten.

As the melting point of tungsten is very high—about  $3,080^{\circ}C$ .—the metal is valuable for use as a filament in incandescent electric lamps, and such lamps are rapidly coming into common use. The whiteness of the light given by the tungsten filament makes it much superior to that of carbon and the efficiency of the tungsten lamp is more than twice as great as that of the carbon lamp. Thousands of filaments can be made from a pound of tungsten.

Tungsten salts are used in fireproofing cloth for curtains, draperies, etc.; in weighting silks; in glass making; as a mordant in dyeing; and for other purposes.

A copy of Mr. Hess's report may be had by applying to the Director, U.S. Geological Survey, Washington, D. C.

## CANADIAN PATENTS.

The following is a list of Canadian Patents, issued by the Canadian Patent Office on Oct. 26, 1909, relating to Mining and Metallurgy and furnished by Fetherstonhaugh & Co., 5 Elgin St., Ottawa, Can. Russel S. Smart, Resident:

121474. N. Langlet, Gothenburg, Sweden. Pros. for precipitating ulmic compounds from the black liquors of soda pulp mills.

121487. W. McCarty, Rocky Ridge, Md. Metallurgical furnaces.

121494. J. H. Reid, Newark, N.J. Pros. for hardening metallic surfaces.

121514. J. E. Teeple, Montclair, N.J. Retorts.

121554. V. Raisin, Paris, France. Pros. of recovering sulphurous acid assigned.

121564. G. L. Meaker, Chicago, Ill. App. for electroplating. Meaker Co.

121574. A. Messerschmitt, Frankfort, Ger. Pros. of producing hydrogen assigned.

## WHAT IS AN ORE?

By J. F. Kemp, D.Sc., Dept. of Geology, Columbia University, N.Y.

(Annual Meeting, Canadian Mining Institute,  
Montreal, March, 1909.)

The definition of a perfectly familiar word sometimes involves unexpected difficulties when we are confronted with the necessity of its expression in unmistakable language. The more familiar the object noted by it, the greater is the surprise of one who finds himself obliged both to delimit from everything else and to put into other words the essential characters. Nothing is more familiar to the mining fraternity than the word "ore." So familiar is it that not every writer of a book on a mining subject has even thought of its definition, having obviously taken for granted the fact that everybody knows what ore is. There are nevertheless some striking differences to be found in the published works, and it may not be without interest to set the matter before the Canadian Institute and see what the impressions of its members are upon the subject.

The variation in conceptions of ore largely rests upon the double use of the word both in a purely scientific and in a technical sense. Sometimes this contrast is not fully appreciated. It will doubtless be admitted by all that there is a group of metalliferous minerals which have been the source of the metals in mining and which as a class may, therefore, be set aside as ores. Thus if I have in my hand an ounce fragment of specular hematite, I may properly say it is an ore of iron. It is a well-known and important member of the group of minerals which have furnished iron to commerce. But if I show you a supposed mining property with only an ounce of specular hematite in it, and in this connection refer to it as ore, you would laugh scornfully. We must, therefore, carefully discriminate in our minds the connection in which the word is used. To this technical use I will shortly pass, since it is the main point of interest, but I wish to clear away a few other preliminaries, relating to the use of the word ore in other senses.

In the microscopic study of rocks we have learned that minerals crystallize from a molten magma in a fairly definite succession and that the earliest group embraces magnetite, ilmenite, specular hematite, pyrrhotite, and one or two rarer metallic minerals, besides several non-metallies, such as apatite and titanite. We often call all these taken collectively as the group of the "ores," as contrasted with the ferromagnesian minerals; with the feldspars and feldspathoids; and with quartz. But we may set aside this use as not bearing in an important manner upon the question.

It is a time-honoured conception of an ore, that it should consist of a metal in composition with some non-metallic substance, such as oxygen or sulphur, which disguises its metallic qualities and which is called a "mineralizer." Native metals are not ores according to this view. The copper of Lake Superior is therefore obtained from "copper-rock," not from ore. Gold is yielded by "gold-quartz," not by gold ore. But I think we must all feel that this old-time usage is no longer sharply observed and that it may well enough drop out. Thus in Mr. T. A. Rickard's interesting little book on "The Copper Mines of Lake Superior,"

we certainly find the output of mines referred to a "ore."

Sometimes also in the mining of the non-metallic substance sulphur, the output of the mine is called "sulphur-ore," although no metal is involved at all. Yet while we may not especially controvert this usage it cannot be said to seriously affect the general and large conception of ore as limited to the metalliferous minerals.

Finally, the word "ore" is used by Milton and other early English writers as meaning a metal itself, artificially produced, but of course this use is obsolete.

Let us now set in order the definitions which have been proposed and which treat of ore in its technical sense. We may then examine them somewhat critically and determine whether they satisfactorily formulate our present conceptions.

The most inclusive and sweeping of the definitions which the writer has found is one given by Dr. R. W. Raymond, on "A Glossary of Mining and Metallurgical Terms," in Vol. IX, p. 160, of the Transactions of the American Institute of Mining Engineers, 1881.

"Ore, 1. A natural mineral compound, of the elements of which one at least is a metal. The term is applied more loosely to all metalliferous rock, though it contains the metals in a free state, and occasionally to the compounds of non-metallic substances, a sulphur ore. 2. Corn. (Cornish) copper ore; tin or being spoken of in Cornwall as tin."

Obviously the above definition is open to grave objection. Thus any mineral which contains a metal as one of its elements without regard to amount would be included. Hornblende with five per cent. iron would be an ore. Some other mineral with a half of one per cent of iron or manganese would equally come within its provisions. To be at all satisfactory we must delimit far more sharply and upon some other basis. Yet from the associations in which the definition appears, one would anticipate a technical rather than a purely scientific expression.

Wm. Humble, an English writer in a "Dictionary of Geology and Mineralogy, etc.," 3d. ed., 1860, gives the following:—

"Ore (erz. Germ.) A metallic compound. Metals are found usually combined with other substances; the compounds they thus form are called ores when the metal exists in them in sufficient quantities to form a considerable portion of the mass."

This definition introduces the idea of quantity, but not as yet in an altogether satisfactory way, the adjective "considerable" not being very definite. At what point do percentages pass from considerable to inconsiderable? Is not 20 per cent. of iron considerable, yet it would not warrant mining. Is 1-1200 of one per cent considerable, and yet it might justify mining for gold? The word "metallic" being sharply used in mineralogy for a variety of lustre, is also objectionable. We might question whether calamine, cerussite, siderite, and many other well-known ores would be included in the definition. Metalliferous is of course better.

Let us take now the two dictionaries which twenty years ago were chiefly cited in English-speaking North America. Worcester (1905 ed.) states: "Ore 1. A mineral body which is reduced to the metallic state by fire; a metal chemically combined with some mineralizing substance which completely disguises its usually recognized and useful properties."

The first sentence of the definition is very objectionable, since wet methods are no less serviceable than fire, in reducing the metals, and this delimitation for ore is obviously ill-chosen. The second sentence brings out the time-honored conception earlier discussed. It is flatly contradicted by Webster whose definition will next be given.

"Ore 1. The native form of a metal whether free or uncombined as gold, copper, etc.; or combined as iron, lead, etc. Usually the ores contain the metals combined with oxygen, sulphur, arsenic, etc. (called mineralizers). 2. (Mining). A native metal or its compound with the rock in which it occurs, after it has been picked over to throw out what is worthless."

The first portion of this definition is so condensed in statement as to be literally meaningless. Thus, as the word native is used in connection with metals, it distinctively means uncombined. How then could the native form of a metal be "combined as (presumably in the case of to be supplied) iron, lead, etc.?" We may infer that native means natural as opposed to artificial; but unless a reader knows more about the meaning of ore than good Noah Webster himself did, this definition will contribute little to clearness of thought. Curiously enough the second definition is scarcely better. Can a native metal be "compounded" with a rock? We usually employ in these senses compound to mean chemical union. Again, is the product of a mine never "ore," until it has been sorted over? Surely the majority of us would impose no such condition.

We come next to a series of definitions in which a distinction is made between the scientific use and the technical use and into which, for the latter, the condition of profit is introduced as a feature, although it is not always insisted on as essential. The late Professor J. D. Dana expresses his views as follows in his *Manual of Mineralogy*, 3d Ed. 1884, pp. 92-93:—

"An ore in the mineralogical sense of the word is a mineral compound in which a metal is a prominent constituent. In the miners' use of the term, it is a mineral substance that yields by metallurgical treatment, a valuable metal, and especially when it profitably yields such a metal. In the former sense, galena, the common ore of lead, is, if it contains a little silver, an argentiferous lead ore; while in the latter, if there is silver enough to make its extraction profitable, it is a silver ore. Further than this, where a native metal, or other valuable metallic mineral, is distributed intimately through the gangue, the mineral and gangue together are often called the ore of the metal it produces. We have beyond to do with ores only in the mineralogical sense.

The Century Dictionary contains a definition, presumably by Professor J. D. Whitney, which is essentially the same:—

"Ore. 1. A metalliferous mineral or rock, especially one which is of sufficient value to be mined. A mixture of a native metal with rock or veinstone is not usually called ore, however, it being understood that

in an ore proper the metal is in a mineralized condition—that is, exists in combination with some mineralizer, as sulphur or oxygen. The ore and veinstone together constitute the mass of the metalliferous deposit, vein or lode. The ore as mined is usually more or less mixed with veinstone and from this it is separated, as completely as may be convenient or possible, by dressing. It then usually goes to the smelter, who, by means of a more or less complicated series of operations, frees it from the worthless material, which still remains mechanically mixed with it, and also sets it free from its chemical combination with the substances by which it is mineralized."

The Standard Dictionary, whose definition presumably passed under the eye of either Professor W. H. Petter or Professor N. S. Shaler, is shaped along the same lines, as follows:—

"Ore. A natural substance, sometimes forming part of a rock, containing one or more metals. The term is applied usually to a mineral from which the metal can be profitably extracted; but is sometimes extended also to non-metalliferous minerals, as sulphur ore."

In these three it is a little uncertain whether, when Dana and Whitney say with regard to profit, "especially," and when the Standard says, "usually," they mean in the technical as contrasted with the scientific use or not. No one of them absolutely prescribes this condition and a reader is somewhat uncertain whether it is essential or not. In definitions it is doubtless better to leave no ground for uncertainty or confusion of thought.

In Prime's translation of von Cotta's "Treatise on Ore Deposits," New York, 1870, p. 1, we find the following: "Under the general term ores are comprehended all minerals and mineral aggregates which from their metallic contents attract the attention of the miner. Metalliferous deposits are therefore for us all local accumulations of minerals or mineral aggregates which correspond to this demand:—

"The idea of the terms ores and metalliferous deposits, in mining parlance, cannot be well expressed in a more precise and scientific manner. There is not any particular class of minerals or of rocks corresponding to these terms. To them belong native metals, metallic oxides, metallic sulphides, and even metallic salts, and their combinations; but on the other hand not all metalliferous species of the Mineral Kingdom, because many of these cannot, either from their nature or the too small percentage of the metal they contain, proportionately to its worth, be worked with profit. No rock, for example, containing 5 per cent. of oxide of iron can be considered an ore; while on the other hand, a vein of quartz, with but 1 per cent. of gold would be regarded as a very rich and valuable metallic deposit, so relative is the idea.

"It is even possible, and has already occurred, that a mineral which for a long time was useless to the miner, and on this account was not considered an ore, has, by means of new discoveries, been included in the category of ores. Blende, for example, when it did not contain valuable metals, could hardly have been considered formerly as an ore, though commonly defined as such; but since a method has been discovered of extracting zinc from it with profit, it may be ranked without doubt among the ores."

(To be continued.)

## Correspondence.

### ELECTROCHEMICAL PLATE AMALGAMATION AND IONIZED GOLD.

To the Editor:—

Sir,—I read with much interest Mr. Carey's learned remarks on the truly wonderful action of electricity when applied to the old and simple process of plate amalgamation. The new adaptation is so simple that one wonders that it has not been thought of before, but so is it with all great inventions.

Mr. Carey himself seems to have overlooked a very simple matter despite his deep scientific study. A very simple matter but one fraught with momentous importance to the whole world and to Ontario in particular. I had not intended publishing this until my financial arrangements were complete, but Mr. Carey's timely article urges me to it. He came very close to it when he spoke of the dynamic quality in the electric flow and of the material ions of Madam Curie. He spoke, too, of the nascent mercury and its wonderful affinity for gold, but he saw only a small part of the glorious truth. He has missed entirely the nascent gold. It is true that the gold he saves is virgin gold and of this, as he truly says, he can save 100 per cent., but there is other gold there—nascent gold! It exists as truly as does the virgin gold, but in its present or nascent form it does not appear as gold. The harsh action of the fire-assay kills it before it is truly born and no sign of it as gold can be found. But by the gentle, kindly but powerful process of ionization, that is by the newly discovered means of controlling the ions of Madam Curie this nascent, this about-to-be-born gold is brought forth in all its beauty as material gold. If Mr. Carey can find me in my laboratory I shall be delighted to show him these ions performing their gynecological functions upon the nascent gold which my delicate and subtle apparatus has proven to exist in large quantities in the Ontario quartz.

It is needless for me to point out to you the greatness of this discovery. I am overwhelmed when I think of it. Think of what it means to Hammond Reef, to Highland Mary, and to all Ontario.

Yours truly,

N. A. Scent.

P.S.—Please do not consider that anything I have said in regard to the nascent gold in Ontario quartz casts any aspersions on the virginal character of Mr. Carey's gold, and please tell me Mr. Carey's address; he writes so beautifully, I want him to write the prospectuses for my forthcoming companies.

Nov. 9, 1909.

Editor Canadian Mining Journal:

Sir,—Mr. Cyril Knight's interesting account of the Winnipeg meeting of the British Association in your last number devotes some space to the Lower Huronian Ice Age, which was briefly described by me in a paper on the Canadian Archaean. The report leaves the impression that the evidence in its favour is by no means convincing. As the Lower Huronian conglomerate is the country rock of nine-tenths of the rich silver veins of Cobalt, it may interest mining men to know something of the evidence for its glacial origin.

Mr. Knight quotes three geologists as throwing doubt on the Lower Huronian Ice Age. All of them are emi-

nent men in their special department, but none of them can be called a glacial geologist, so that their opinions on the subject must be looked on as off-hand rather than carefully studied. President Van Hise's suggestion that somewhere a glaciated basement ought to be found beneath the conglomerate ignores the fact, well known to glacialists, that near the edge of a glaciated area where the thickness of ice is not great the ice sheet often moves for many miles over loose materials without ever reaching the rock surface beneath. This is true of thousands of square miles of glaciated country in certain States to the south of us, and is true also of most of the area covered by carboniferous boulder clay in India. The carefully studied conglomerate area at Cobalt makes up in all only a few square miles. There is a much larger area of Pleistocene boulder clay showing no striated surfaces in the neighbourhood of Toronto. Probably as our knowledge extends a striated floor will somehow be found beneath the Lower Huronian tillite; but its absence in the small area known has no force as an argument against its glacial origin.

The real test of glacial action is to be found in boulder clay and the glaciated stones contained in it. This is the final proof of ice action at any age. To the geologist unfamiliar with ancient tills the Cobalt conglomerate may look very unlike the boulder clay softening under the rain about him, merely because it is a very firm, hard rock; but anyone who has seen an ancient boulder clay such as the South African Dwyka, is impressed by the striking resemblance between the two. If only a small patch or two of the boulder conglomerate was known, Dr. Miller's suggestion of freshet action would be reasonable, but surely no one will claim that freshets have formed the thousands of square miles of boulder conglomerates in northern Canada reaching from Lake Chibougamou to Lake Winnipeg, and often enclosing boulders tons in weight miles away from any known source. Likewise no one will imagine that freshets can produce the beautifully striated stones found in the Lower Huronian boulder clay.

Prof. Hobson's suggestion that the striations might result from other causes glacialists are not likely to accept. No cause, such as faulting or mud flows, has ever been shown to form anything approaching a typically glaciated stone, and the dozen specimens shown at Winnipeg are typical striated stones with markings on several sides, and even with minute "chatter cracks," as Mr. Taylor pointed out to me after examining the collection with a lens.

The impression produced by the specimens and lantern slides on the glacial geologists present in Winnipeg may be shown by the following quotation from *Nature* (Oct. 7, 1900, p. 446):—

"In the subsequent discussion Drs. Fairchild, Strahan, Warren, Upham and Derryhouse expressed the opinion that Prof. Coleman had established his contention." It should be added that Messrs. Leverett and Taylor, who did not speak, are in accord with the others, and that Mr. Tyrrell, after a thorough study of the stones, can explain them only as glacial.

Everyone familiar with Pleistocene geology will agree that the names just given include several of the most competent and experienced glacial geologists in the world.

The evidence for the glacial origin of the Lower Huronian conglomerate presented in three papers published during the last two years has been widely accepted in the Old World as well as in America. For instance, Prof. Haug, of Paris, founds upon my results his discus-

sion of ancient climates in his recent book on geology, one of the most important works on the subject produced of late years.

When every glacialist who has examined the specimens obtained at Cobalt accepts them as glacial, and when doubts as to the value of the evidence are confined to non-glacialists, it looks as though the proofs of a Lower Huronian Ice Age must be fairly satisfactory.

A. P. COLEMAN.

### PERSONAL AND GENERAL.

Major Boyd McGee, General Manager of the Keeley mine, South Lorraine, is not the McGee referred to in press notices of the Russell extradition proceedings.

The Hon. Robert Rogers, Provincial Treasurer of Manitoba, was in Montreal recently. Mr. Rogers is one of the directors of Black Lake Consolidated Asbestos.

The Montreal office of the Robb Engineering Co., Limited, Amherst, N.S., has been moved to 607

Canadian Express Building, Montreal. Mr. R. W. Robb is manager.

Messrs. Pellew-Harvey and Fell, mining engineers and metallurgists, of 62 London-wall, E.C., state that the partnership hitherto existing between Mr. E. Nelson Fell and Mr. W. Pellew-Harvey has been dissolved by mutual consent as from the 1st inst. Mr. Fell retires from the firm and the business will be carried on as heretofore by Mr. W. Pellew-Harvey in the name of Pellew-Harvey & Co.

The efficiency of furnaces of various kinds has been investigated by J. W. Hull, a British metallurgist. The greatest efficiency in ordinary work was found in the use of an English blast-furnace making pig-iron, not less than 81.7 per cent. of the heat given by the fuel being utilized, but 65.3 per cent. escaped from the furnace and was recovered outside. A puddling furnace not fitted to a boiler wasted 91 per cent. of the heat. The most wasteful furnace of all, however, was proven to be the common coke crucible furnace employed in making steel, as this uses only 1.43 per cent. of the heat. 98.57 per cent. being lost.

## SPECIAL CORRESPONDENCE

### NOVA SCOTIA.

Glace Bay, Nov. 4.—The U. M. W. A. Strike.—Repeating the figures given in the last two letters, the output figures of the Dominion Coal Company for the month of October compare as follows with the preceding months of the strike period:—

|                     | Total<br>Output. | Average Daily<br>Output. |
|---------------------|------------------|--------------------------|
| July . . . . .      | 136,000          | 4,200                    |
| August . . . . .    | 154,000          | 5,900                    |
| September . . . . . | 180,000          | 7,200                    |
| October . . . . .   | 205,000          | 8,200                    |

For the last week in the month the output averaged around 8,800, and on one occasion it went over the 9,000 ton mark. How very ineffectual the so-called strike is at the older mines of the company is shown by a comparison of the outputs for the month with those of October last year:—

|                           | Oct., 1908. | Oct. 1909. |
|---------------------------|-------------|------------|
| Dominion No. 1 . . . . .  | 44,063      | 51,076     |
| Dominion No. 2 . . . . .  | 49,769      | 44,522     |
| Dominion No. 3 . . . . .  | 19,443      | 18,726     |
| Caledonia No. 4 . . . . . | 31,156      | 23,874     |
| Reserve No. 5 . . . . .   | 28,531      | 29,896     |

The total output for the month was 205,000 tons, comparing with a total of 265,000 tons last October. Two of the company's mines, namely, Nos. 6 and 7, have not worked since the strike commenced, and if their output is taken into account, the production for the past month was only 29,000 tons below that of last October. It hardly looks as if the U. M. W. A. were correct in their pre-strike statement that they controlled 95 per cent. of the output, or that four thousand miners were on strike. In the face of the foregoing figures the reader may form his own estimate of U. M. W. A. arithmetic. This increase in outputs has not been obtained by any large importation of foreign strike-breakers, for the number of actual foreigners which have

come to Glace Bay since the strike commenced does not exceed one hundred men. At least 80 per cent. of the men who have filled the places of the strikers are residents of Eastern Canada, and probably seventy-five per cent. of these are natives of the Island of Cape Breton. The entirely foreign nature of this strike is now more clearly apparent than ever. It was called to obtain recognition of a foreign union, has been financed entirely by foreign funds; the majority of the strikers are persons born out of Canada, and the two outstanding results of the strike are at present the impoverishment of a Canadian industry, side by side with the enlargement of the United States coal sales in our own country. There are all kinds of side issues connected with this strike, such as loss in wages and hardships which must be borne by the strikers and their families, the breaking up of pleasant relations between the Coal Company and their employees, and many other things all more or less unpleasant, but the two main results are as stated, loss to Canada and gain to the United States. This cannot be gainsaid, and its moral is too obvious to need elaboration.

**Renewal of the "Shortt" Agreement.**—During the latter half of October negotiations were carried on between representatives of the Provincial Workmen's Association and the management of the Dominion Coal Company for a renewal of the award of the Conciliation Board in 1908, and under which the P. W. A. has worked through the trouble caused by the U. M. W. A. agitation. The company offered to renew the agreement in its entirety. This proposal was considered by the lodges, who reported in favour of acceptance, and a meeting of the Grand Council authorized this step. A very large committee of the P. W. A. representing all the lodges met the management of the Coal Company on the 4th of November, and it was finally arranged to sign an agreement continuing the present contract in force until December 31st, 1911. One of the demands of the P. W. A. before the Board of Conciliation in 1908 was a 15 per cent. increase to the able-bodied unskilled labourer, who at that time was rated at \$1.38 per day. The Board awarded an

increase of 10 per cent., making the maximum wage \$1.52 per day, which was the rate offered by the company in Schedule No. 1. This rate has now been raised by the company to \$1.60, being a 5 per cent. increase on the award of the 1908 Board. The terms now accepted by the P. W. A. for a further two years are a very substantial increase on the rates which were paid under the three years' contract signed in 1904.

No better proof of the vitality of the P. W. A. could be asked than the signing of this contract, and it is an open secret that their desire to continue the present arrangement has been crystallized by the extraordinary action of the U. M. W. A. executive in proceeding against the coal operators on a charge of criminal conspiracy to raise the price of coal. The U. M. W. A. campaign has been from the first conducted in a very unintelligent and foolish manner, but nothing it has yet done has been so calculated to lower its prestige and alienate its dupes as this particular ineptitude. One could almost question the sanity of a body of men who first of all ask for a preposterous advance in wages from the management of a coal company which for three years had been losing money, then stop the production of coal by striking, and finish up by prosecuting this company on suspicion of endeavouring to get a reasonable profit on its product. This is exactly what has happened at Springhill. The ultimate object of the lavish expenditure of American money in Nova Scotia is too palpable to deceive any but those who deliberately close their eyes to it, and it is certain that nothing has so thoroughly alarmed the miners of Nova Scotia who think about these things as the action of the U. M. W. A. against Messrs. Dick and Cowans. In the matter of markets and price the interests of the miner and of his employer are identical, and the willingness of the two parties to the two years' contract to renew arises from a realization of the imminent danger in which our coal markets stand from the United States operator and the U. M. W. A., and a grave sense of the common danger which loss of trade most certainly spells to both employees and employers in Nova Scotia.

**Birds of a Feather.**—A little while before the U. M. W. A. strike Glace Bay was favoured by the presence of Kier Hardie, a gentleman whose recent remarks about the melting pot and His Majesty's crown have caused a wholesome revulsion against him and his ilk. For a brief space we had the pleasure of the company of Mr. E. McCullough, an American citizen, who told a Sydney audience that Canada's national ambitions were "tommyrot," and who referred to our soldiers as "pimps." Then we suffered the lueubrations of an aspiring member of the Trades and Labour Congress from Toronto, whose reportorial feats induced the Grand Council of the P. W. A. to refer to him as "a shameless prevaricator." We are to have Hr. Haywood, a person who became notorious in Colorado in connection with the Western Federation of Miners. The last state of this town appears to be worse than at first.

One of the things "which no fellow can understand" is the attitude of the politicians of Canada towards our rapid industrial development. The Government, which happens to be in power at any well-marked stage of our natural expansion, takes credit for that particular evidence of growth, and proudly refers to it as being associated with itself. One often sees in the newspapers and in campaign literature tables showing the expansion of the country's finances, its transport facilities, or exports under such and such a period of Liberal or Conservative rule, and the last-named accident is claimed as the cause of the expansion. This seems to us so much moonshine. Governments come and governments go, as they reflect the mood of the voters, the wealth of the campaigners, or as one party selects a more attractive election issue than the other. There is no essential difference in the aims or the principles of our two leading political parties, and their existence is merely a necessary condition of that form of government by opposition which is a tradition with the Anglo-Saxon. In Nova Scotia, however, we are so unfortunate that one devoted industry has

become the shuttlecock which has to withstand the buffetings of the party battledores.

The Dominion Coal Company was conceived by a Liberal, and was carried through under a Liberal administration. The incorporation of this company was objected to by the other political party only because it was advocated by the party in power. The incorporation of the Dominion Coal Company simply came about because the times were ripe for it, because the genius of one man saw its necessity and its possibilities, and because the coal industry of this island needed some such consolidation of interests to prevent useless expense and waste, and to make progress a certainty. The expectations of those who incorporated the Coal Company have been more than justified, and, as we remarked in a previous letter, the formation of the Dominion Coal Company was the inception of the greatest single impulse ever given to the commercial prosperity of Nova Scotia. But no political party can with fairness take all the credit for this. It would have come, no matter which side held the reins for the nonce.

Nevertheless, the opposition towards the Coal Company has never ceased, and for purely party reasons it has been fostered and kept from dying of sheer inanition. By a peculiar mental process the enmity has spread to the whole coal trade of the province, and certain newspapers never lose an opportunity to villify the coal industry and damage as much as possible all connected with it. It is not necessary to name these papers, for their daily perversions and libels are the bane of every coal man in the province. Plain every-day men might think that matters of common interest could be lifted out of the maelstrom of politics, and surely it is not for the benefit of any business conducted in our midst that it should be unremittently assailed for mere party gain. We have in this province some of the most magnificent collieries in operation. Our mining methods will bear comparison with anything on this continent. Yet one never sees a word of commendation on this score, and the visiting engineer who takes our provincial press seriously must be sorely puzzled at times to reconcile what he reads therein with the actual conditions as they present themselves to him. Surely there is no other place where the newspapers open their columns to anonymous letters criticizing not only the policy of the coal companies, but also the most intimate details of their technical management and the pitmanship of the officials. These are matters for the Mines Inspector and those whose duties fit them to pass upon them. When a newspaper takes upon itself to criticize the management of a colliery it usually falls into laughable and egregious error, which is some consolation, but it seems to us a regrettable thing that it should have become a tradition with a certain section of our provincial press to everlastingly "knock" the coal industry. The outsider who is not acquainted with Nova Scotia's family squabbles may be excused if he acquires a poor opinion of our coal trade generally. Very recently Glace Bay was visited by a gentleman from the High Commissioner's office in London, who expressed surprise at finding such up-to-date machinery and methods, as he phrased it, "tucked away in a little corner of Canada like this." He was unable to understand why the newspapers should refer so slightly to the mines and their management, and we were unable to enlighten him. As the Montreal Gazette recently remarked, "politics have entered into the strike situation in Nova Scotia in a manner that no person outside of Nova Scotia can understand." To understand the attitude of the Nova Scotian party press towards the coal industry is difficult, but to justify it is impossible.

#### ONTARIO.

**Cobalt, Nov. 4.**—During the past summer some of the best finds in the history of the Nipissing Mining Company were made. One of these, which is known as vein No. 114, was found near shaft 26, but when first discovered little work was done,

as it was decided to cover as much territory as possible during the season. A few days ago, however, a force of men started to work stripping the vein, and toward the east the vein widened from one inch to three inches of high-grade ore. About 250 feet of stripping has been done, and shows a rich ore shoot for a distance of 50 feet. During the winter a cross-cut will be started from the 85-ft. level of shaft 26 to cut the vein.

The returns from the last sale of the Gillies Limit lots were so satisfactory to the government, they have now announced a third sale, which will take in about 1,200 acres directly south of the land already sold. It is understood that this new area embraces some very promising territory, and it is probable that considering the discoveries that have lately been made in this section, that the prices will be fairly high. The total area of the Gillies Limit amounts to about 64,000 acres, and of this about 2,100 acres have been offered or sold. The tenders will close on the 15th Nov. Hundreds of prospectors are looking over the territory, and a number of valuable finds have been reported, which will no doubt make prices much higher on this sale than the previous ones. Many of the mining companies have sent out their own men to look over this territory.

The new government road which is being built into Gowganda will undoubtedly have a very important effect on the future of that camp. It is estimated that there is at present in the ore houses of the different mines about ten carloads, which will be shipped as soon as the winter roads are in condition. It is interesting to note that the Reeves-Dobie company has made a contract to ship out their ore at \$15 per ton to Sellwood. The shippers will be the Boyd-Gordon, Reeves-Dobie, Blackburn and the Mann, and it is probable that the Bartlett will send out some.

In sinking the winze for the 150-ft. level of the Coniagas a new vein was encountered just below the contact between the keewatin and the conglomerate, and in the keewatin formation, running at right angles to the vein on which the winze was started. The winze has been continued some distance below the point at which the vein was struck, and the ore in wall rock still carries small values in silver. The winze will be continued to a depth of 75 feet, and from the bottom a crosscut will be run to a point below the shaft, and then a raise will be started to connect up the two workings. All the machinery for the new addition to the mill is now on the ground, and the work of installation will be pushed as rapidly as possible. This company has ore reserves which probably are second to none in the camp, and as their veins are narrow and the wall rock heavily impregnated with silver, the supply of mining ore is very large. The capacity of the mill when completed will be 160 tons a day. The announcement that this company would declare their regular quarterly dividend on Nov. 1st was rather a surprise. In July the directors issued a circular stating that the quarterly dividend due Aug. 1st would not be paid, as the company needed the funds to complete the addition to the mill at Cobalt and the smelter at Thorold, and although it was known that the suspension was only temporary, it was believed that the dividend due Nov. 1st would also be passed.

The work that is being done at the Cobalt Lake has lately been productive of very favourable results, and considerable quantities of high grade ore are being mined. A new ore shoot has been discovered in the vein that was traced along the McKinley-Darragh boundary, and ore carrying up to four thousand ounces of silver is being taken out. The vein that was struck some time ago is still carrying good silver values.

A case that has aroused much interest lately is the claim of Mr. Douglas Balfour in relation to a property in the Miller Lake district, known as M.R. 1098, the defendants being James Hylands, Gardner and Johnson. The claimant Balfour asked to have the mining claim declared invalid, for several

causes, among these being non-performance of the necessary work, it being stated that the thirty days' work to be performed directly after the claim had been staked was not done. In regard to the contention the Mining Recorder stated that the holders of the claim did commit a technical violation of the Forest Reserve regulations, but he considered it unwarrantable to declare the claim invalid. To do so would, he believed, disturb nearly half the mining titles in the forest reserve, as a practice had grown up in the district of doing the necessary work without waiting for the receipt of the formal permission. There has been considerable agitation lately in the outside districts on account of the efforts of various claim-jumpers to acquire properties that they thought would make good, as on account of the peculiar nature of the mining laws it is very difficult for the original stakers to hold their claim without some technical violation of the Mining Act.

Another promising lead has been found on the 100-ft. level of the Silver Leaf. It has been drifted on for some distance and shows about five inches of calcite and smaltite with some values of native silver. Another very good vein was struck at a point about fifty feet from the Crown Reserve line on the 100-ft. level, and it is thought to be an extension of one of the Crown Reserve veins. Where it was encountered it showed a width of about 12 inches of high grade ore. Since mining was started on the Silver Leaf, the ore where found has always been very pockety, but the veins met lately under the Crown Reserve management seem to give promise of greater extent. Under the lease by which the Crown Reserve holds the Silver Leaf, the latter company receives 25 per cent. of the gross value of the ore, on condition that \$20,000 is spent on the property the first year, and \$10,000 annually for the four remaining years.

At the annual meeting of the Little Nipissing Mining Co. held on Oct. 20th, the decision to increase the capitalization of the company from one million to one million and a half dollars was confirmed. The directors also authorized the sale of 250,000 shares of the new stock at twenty cents a share, to be first offered pro rata among the shareholders. The meeting was very stormy and Mr. S. D. Madden and Mr. A. Ferland retired from the directorate.

The Coleman Development Company has decided to start diamond drilling on its properties in Coleman and Lorraine Townships. Considerable prospecting is also being done at the present time. It is estimated that there are now nine diamond drills at work in the Cobalt camp, in addition to these two are operating in South Lorraine, one at Silver Lake and one at Miller Lake. Practically all the companies in camp have at one time or the other resorted to that method of prospecting. Considering the narrow veins that are found in this district it is not to be expected that the same results can be obtained as in any other district, where the ore bodies are much larger, but nevertheless they have been the means of finding many new veins. The most important feature, however, has been the knowledge they have given regarding the different formations, that has encouraged several of the companies to continue their workings at greater depth, when they had thought that they had practically reached the limits of their ore bodies.

The Wyandoh, under the management of Mr. Nesly, will commence active development work at once. The company has decided to install a steam driven compressor and the other necessary equipment, bunk houses and other buildings will be erected as soon as possible.

An interesting report has recently been issued by Col. Carson on behalf of the directors of the Crown Reserve, covering the first nine months of 1909. It shows that during this period a total of 84 cars of ore were shipped, and 22 of these were high grade. The total net value of the ore amounted to \$1,368,951, the net profit on operation amounted to \$1,078,806. Of this

amount \$795,966 was paid out in dividends. The surplus on September 30th was \$629,957. On November 1st winzes were started to the 300-ft. level. These will be connected up, and the main shaft also connected at that depth. During this period a total of 3,336 feet of development work was done.

The development of the Wetlauffer mine in South Lorraine has shown that the high grade ore which was found at the 50-ft. level has continued to the 100-ft. level, and at that depth it is fully as rich, and the veins are wider than on the upper level.

tion was met with from the Railway Commission, as at first the refused to permit this work to be carried on on the right of way. The opposition was overcome, however, and work will be started in a short time. It is understood that good indications have been encountered in the diamond drill hole which was bored at this point.

The Right of Way Mines, Ltd. has issued a circular to its shareholders requesting them to forward their certificates to the secretary in order to receive an exchange for the certificates of

The second shipment of high grade ore will be made from the mine this week, and the development of the property is progressing to such an extent that it is believed that regular shipments can now be maintained. This district is commanding much attention on account of the number of important discoveries that have been made there during the past summer, and it is believed that it will develop into one of the best sections outside of Cobalt.

The Station Grounds Mining Co. has decided to sink a shaft on their property near the railway track. Considerable opposi-

tion was met with from the Railway Commission, as at first the refused to permit this work to be carried on on the right of way. The opposition was overcome, however, and work will be started in a short time. It is understood that good indications have been encountered in the diamond drill hole which was bored at this point.

The Cobalt Paymaster Mines, Ltd., which was formerly known as the Amalgamated, has secured the entire holdings of the Cobalt Treasury Co., including practically all the mining rights under Sasaganiga Lake, and 66 feet of the shore line on that portion of the Hudson Bay and Trethewey claims adjoining the lake. The main shaft is down 115 feet, and about 600 feet of drifting has been done at this level, and some cobalt ore

carrying small values in silver has been encountered. A diamond drill has started to work, and holes will be bored underneath the lake, to crosscut veins which have been traced to the lake shore.

An important discovery has been made on the Newman property, which adjoins the Great Northern in South Lorraine. The vein varies in width up to six inches, and carries high values in silver.

The American Smelting and Refining Co. has been served with a writ by the lawyers acting for Messrs. D. M. Steindler and A. M. Jacobs, which prevents them paying \$7,000, the proceeds of a shipment of ore from the Peterson Lake Co. This money has been attached in connection with a suit brought by these gentlemen against the mining company for some \$28,000, which they claim is due them for money advances.

It is understood that an English syndicate, after careful examination of the Trethewey mine, has taken over the balance of the treasury stock, amounting to 54,450 shares, at \$1.50 a share. In conjunction with this announcement it is stated that the next interim dividend will be 15 per cent. This will bring the total dividends for the year up to 25 per cent.

Great interest has lately been displayed in the gold discoveries at Porcupine Lake, which is west of Night Hawk Lake. Many prospectors have already gone into the district, but as the majority of the smaller lakes are now frozen over, many who would otherwise go in, will not be able to do so for some time. Engineers of the Ontario Government have visited this new gold field, and are convinced that at least some of the discoveries made give promise of good results. The discoveries are all of gold in quartz, and in places veins have been traced for several hundred feet. Some of the samples showing free gold are very spectacular, and it is stated that average assays from different veins have run nearly \$200 to the ton. It is probable that this section and the Larder Lake district will be the centres for the prospectors for the coming winter. Several hundred men have already made their way into the Larder Lake district, and this number will probably be largely augmented in the near future.

**Kenora Mining Division.**—A general meeting of the prospectors' and Mine Owners' Association of the Kenora Mining Division, was held in the Town Hall, Kenora, on Tuesday, November 2nd.

A letter was received from J. Edwards Leekie, of Cobalt in answer to a request from the Association for an expression of opinion as to the fairness to the prospector of the time given him in which to do his first 30 days' work (Mining Act, Ontario, Sec. 78, Sub-Sec. 1, Clause (a)). The opinion voiced by Mr. Leekie was that during the months of June and July it should not be obligatory to do assessment work on account of the very real hardship of trying to work in these months because of the flies and mosquitoes. In his opinion, while a prospector should be permitted to work during these months, if he so desired, it should not be compulsory for him to do so.

The meeting then discussed some needed changes in its own constitution, and finally elected a By-Law Committee to carry on this work.

The subject of applying to the Government to have a geologist come into this district and make a geological survey was then discussed; some members pointing out that the last visit paid to this district by a geologist was a very short one of a few days some 12 years ago, and that the present geological map of the district was incorrect in several particulars.

It was finally agreed to draw up a resolution re Government Geologist and submit it to the next general meeting to be held December 7th.

In order to be of greater use to the prospector coming into this district it has been decided to give an account of the various trails and routes and methods of transportation best

for this district, together with a list giving approximate cost of outfit for prospecting and the places where necessary stores and outfits can be purchased together with such information and advice as may be of use to prospectors new to this neighbourhood and commencing operations here.

#### BRITISH COLUMBIA.

**Rossland.**—The Consolidated Mining & Smelting Co. of Canada, Ltd., at its annual meeting increased the capitalization of the company by two millions of dollars to \$7,500,000. In view of the fact that the company has during the last fiscal year acquired several claims adjoining the St. Eugene mine at Moyie, and has secured control of the Monita, Mugwump and City of Spokane properties at Rossland, adjoining the War Eagle, and as \$24,444.33 has been spent in putting the Richmond-Eureka in working condition, a large sum of money has been expended on the Snowshoe and Phoenix Amalgamated mines in Phoenix; as we say, in view of this heavy expense in work to advance the future interests of the company, this increase of capitalization is looked upon rather favourably here in British Columbia. It is generally known, too, that it will take considerable money to get the Phoenix Amalgamated group in producing form. The amount of money spent in acquiring new mines and real estate was \$77,836 for the year ending June 30th, 1909.

The company earned a net profit during the year under review of \$329,004.08. This figure was arrived at after writing off the usual accounts including \$153,218. depreciation and \$563,413 expended on development work. There was spent in augmenting the working plants at the different mines of the company \$164,951. The figures indicate good progress and if the profits were not exceptionally large the metal market can be blamed to some extent, as the company had to absorb about \$56,000, shrinkage in metal quotations. During the year steady shipments were maintained from the St. Eugene, Centre Star group and the Snowshoe mines, while occasional shipments were made from the Richmond-Eureka and Phoenix-Amalgamated properties. The amount expended for development work, however, speaks for itself; a good supply of ore was kept in sight all the year and no attempt made to force shipments. The shipment from the five groups for the year ending June 30, 1909, amounted to 480,533 tons, valued at \$4,012,587, or an average of about \$8.35 per ton. Rossland ore averaged approximately \$10.55 per ton; St. Eugene ore \$9.08; Snowshoe, \$4.76, Richmond-Eureka, \$40.84.

It is with gratification that shareholders here of the stock of the Le Roi 2, Ltd., hear that they are now to receive a third dividend of two shillings per share this year, which will possibly be followed by another such dividend at the end of the year from the earnings of the current period. It is certainly pleasing to note that this concern continues to pay dividends in the face of the somewhat heavy expense it is under in deepening the main Josie shaft. The output of the mine is being maintained at about 1800 tons of ore per month that should average \$23.00 per ton and which under existing conditions would mean a clear profit of \$10.50 to \$11.50 per ton.

The lessees of the Velvet-Portland group have a small crew of men working about the mine and on the road and bridges to the railway siding, a distance of seven or eight miles. The contract has been given for the haulage of ore and concentrates. Two 4-horse teams will be able to handle the output for the time being.

The bond which Chas. Dempster of Rossland and New York, has been working under on the Hattie Brown property in the debatable South Belt district of Rossland, has been permitted to lapse. It seems that one of the principal payments fell due a

few days ago and while the bondholders were willing to go ahead with the development work, on the showing that they then had, they did not consider it good business to make any large payments on principal. As the owners held out for the payment the bond was allowed to lapse and development work has been discontinued by the Dempster Syndicate.

The Fife Mines, Ltd., has ordered a 100 h.p. boiler plant and five drill compressor plant, drills, hoist, etc. for the property at Fife. It will be installed in about 45 days.

**Phoenix.**—The Boundary mines surpassed all past records for the week ending October 23rd, the total shipments for the district going up to 43,569 tons. With seven big furnaces working full blast at the Grand Forks smelter, the Granby sent down 27,573 tons of ore, exceeding the high record mark of February 13th by 2,000 tons. It is expected that the eighth furnace will be put to work next week, when the shipments will be even larger.

The British Columbia Copper Co. shipped 11,396 tons from the Mother Lode mine, which is the high shipment mark for the year. From the Oro Denoro property this company sent 950 tons, only exceeded previously this year by the shipments of the previous week, of 1,200 tons. This is considerably over the average of 300 tons per week that was maintained in the early part of the year. Regular shipments were made by the Snowshoe of about 3,800 tons.

The annual report of the Granby Con. M. S. & P. Co. for the year ending June 30th, 1909, which has just been made public, subsequent to the company's annual meeting, is a favourable one when the many drawbacks that occurred during the year are considered. The gross earnings of the company for the year amounted to \$3,983,536, while the net profits were \$681,134, or about 17 per cent. on the total earnings. From this amount \$270,000 was paid in dividends, the balance going to surplus. The total mining, smelting, converting and marketing charges per ton were \$3.20, which, after the deduction of gold and silver, made the cost price of copper to the company 10c per lb., which was .0024c lower than for the preceding year. Owing to the large quantities of ore that were caved during the year, the grade averaged low, the extraction being 21.81 lb. copper, .2724 oz. silver and .0434 oz. gold per ton. There was a saving, however, in mining costs, that more than equalized the cost of running the low-grade material through the smelter. The average price obtained for copper during the year was .1322c; silver, .5125c, which was somewhat lower than for the prior year.

A small crew of miners has been put to work in the Elkhorn mine at Greenwood by the Boundary Development & Exploration Syndicate.

The good work that has been going on in the Tulameen platinum district in the way of geological survey has been finished for the season, and Chas. Camsell, geologist in charge, has returned to Ottawa.

The Vermillion Forks Mining & Development Co., a London concern, has begun work on its property near Princeton. There is a quantity of coal now ready for shipment, and a couple of cars will be tried by the Hedley Mining Co. shortly. It is thought this coal can be laid down in Hedley for about \$5 to \$6 per ton, whereas, at present consumers there are paying in the neighbourhood of \$13 per ton for coal from the Crow's Nest and elsewhere. When the Princeton mines are producing a heavy tonnage, a market for part of the output may be found in Spokane, Wash., and vicinity, where this coal should be laid down at a reduction of a dollar or two below what consumers there are now paying.

While none of the New Dominion mines are at work yet, the trend of affairs is toward an early resumption of work. The unpaid wage cloud has now been cleared up. The old company owed its miners about \$22,000 when it closed down. The new concern did not feel obliged to liquidate this debt, but considered that it should be attended to, so that in future they would be on good terms with the miners, and thereby avoid any possible friction; so they proposed to pay the wages due on a basis of 75 per cent; the local merchants, anxious to see things squared up in this matter, granted a reduction of 12½ per cent. on accounts that were related to the matter, and after some deliberation the miners accepted. One of the crushers at Boundary Falls is being placed on the Rawhide ground, preparatory to resumption of work.

**Nelson.**—It is expected that the C. P. R. will equip its Rossland and Phoenix branches, on which ore is hauled, with electricity next summer, as its engineers find that economy of operation can be gained by using power from Bonnington Falls.

The output of the Crow's Nest Pass Coal Co. is being materially increased since the new compressor was installed.

Steady shipments are being maintained by the Blue Bell, Cork, Highland-Buckeye, Rambler-Cariboo, St. Eugene, White-water, Van Roi and Yankee Girl mines to Trail smelter.

The Searchlight group in Sheep Creek district has been acquired by a local syndicate, one payment being made. The second payment has been made on the Golden Fawn, adjoining the Mother Lode. A contract has been let for tunnel work on this property. The usual milling operations are going ahead in Sheep Creek district at the Nugget, Kootenay Bell, Queen mine, etc.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Inverness.**—A foolish attempt was made on Oct. 23 to wreck the works of the Inverness Railway and Coal Company. The offenders were U.M.W.A. strikers. The attack was to take place before daylight. Warning had been given the company. The attempt failed signally. Five men were arrested and summarily dealt with.

**Halifax.**—The search for Captain Kidd's treasure at Oak Island has been abandoned. The Old Gold Salvage and Wrecking Association of New York has stopped work. Captain Kidd has much to answer for. It is probable that this treasure was

buried in one of the unexplored gold districts. This is a reasonable enough assumption to justify ardent prospecting.

**Sydney, N.S., November 2.**—Although the Dominion Steel Co. is not giving out any monthly figures just now, it is understood that the output for October was more than satisfactory.

The rod mill output, especially, was very large, beating the world's record for one mill by several hundred tons.

### ONTARIO.

**Ottawa.**—The Public Accounts Blue Book gives figures of expenditure for the past fiscal year. In iron and steel bounties the

sum of \$1,864,614 was spent; in lead bounties, \$807,433; and in bounties on crude petroleum, \$260,698.

**Ottawa.**—Mr. Wilson Foster, of Dawson City, has presented to the National Museum a collection of ten thousand specimens of minerals, ores, and precious stones.

**Bancroft.**—The Bancroft marble quarries which contain notable quantities and several varieties of excellent marble, are being opened and equipped vigorously under the superintendence of Mr. T. Morrison.

**Madoc.**—Square-set timbering is being used at the Henderson talc mine at Madoc. Timbering costs about 15 cents per ton of output.

**Hamilton.**—The Hamilton Steel and Iron Company has announced that it will spend approximately \$1,000,000 on enlarging its plant to meet increased trade conditions. The majority of the stock is owned in Hamilton.

**Port Arthur.**—The Thunder Bay Harbor and Improvement Co. has almost completed building the dock for the Bessemer Iron Co. at Camp Beulah. There are 13,000 tons of ore on the dumps ready to be taken to the docks and loaded.

**Elk Lake.**—It is estimated that about ten cars of ore will be ready to ship from the Montreal River district this winter. At 25 tons per car and 1,000 ounces per ton—a pure guess—the possible shipments will aggregate 250,000 tons, roughly \$150,000 gross—not a negligible quantity of money.

#### BRITISH COLUMBIA.

**Phoenix.**—It is announced that the C.P.R. will immediately commence the construction of a branch line from Phoenix to Wellington camp. The first section to be built will be the first three miles of the twelve miles to Central Camp. The route is rough, grades are heavy, and considerable cutting and filling must be done.

The New Dominion Copper Company has issued checks to all unpaid miners of the former Dominion company. The total was \$20,000.

**Nelson.**—Marble quarrying has been actively begun at Marblehead. 75 men are employed. Three Sullivan channelers are installed. The output is about 12 cars per week.

**Vancouver.**—It is reported that the Guggenheims have gained control of the Western Fuel Company's properties on Vancouver Island.

**Rossland.**—The Hedley Mining Company is testing two carloads of coal from the Vermilion Forks Mining Company. If satisfactory, the fuel will be purchased regularly.

**Rossland.**—In the week ended October 30, Le Roi recommenced shipments of ore to Trail. 21 carloads were shipped, mostly from the 1650-foot level. The ore was of fairly high grade. This is the first shipment made since March. Diamond drilling has been successful in locating new ore bodies.

**Yukon.**—Discoveries have been filed with the mining recorder at Dawson on two streams tributary to the Forty-Mile River. One stream is Mickey Creek and the other Maiden Creek. The streams enter the Forty-Mile on the right limit between four and six miles from the mouth.

Stephen Macfie staked discovery on Mickey and William Hayhurst discovery on Malden. Both these streams had been prospected in early days.

Donahue Gulch, a tributary of the Yukon, on the right limit, five miles below Thistle, is the scene of a new discovery by Alex. Middleton and William Middleton. They also have staked two adjoining bench claims.

The renewals of placer claims the last ten days have aggregated 100, bringing the Government \$1,000 in fees. Thus far in October \$5,000 has been taken in for renewals, representing 500 claims. The properties are in all parts of the camp.

The quartz department is more than crowded. The quartz recorder is almost buried under the increased business in that department. He works under pressure all the time, and then, in order to keep up with the pace of stakers and applicants for certificates of all kinds, often is in the office after hours. The entire force of the gold office has none too much time.

## MINING NEWS OF THE WORLD.

#### EUROPE.

##### SPAIN.

**Lisbon, Oct. 22.**—It is announced that the Portuguese Government has granted a concession for mineral research over an area of 25,000 square miles in Portuguese East Africa, situated between latitudes 13 deg. 30 min. and 15 deg. 10 min., and not far from Blantyre, in British Central Africa, to a group of influential London and South African capitalists.

##### FRANCE.

**Paris, Oct. 22.**—On the 3rd November the technical delegates appointed by the British, French, German and Spanish Governments will meet at Paris to discuss officially from the technical point of view the draft Mining Law for Morocco provided for in the Algeiras Act and elaborated with Mulai Hafid's assent by M. Porche, a French engineer in the employ of the Maghzen. The results of this examination will be submitted to the diplomatic body at Tangier, in accordance with the Algeiras Act,

and, if approved by them, will be promulgated by the Sultan of Morocco. This procedure has been adopted with the object of simplifying the work of revision on the part of the diplomatic body at Tangier. M. Porche's draft law is framed with due regard to the peculiarities of foreign legislation on mining questions.

**Paris.**—M. Millerand, Minister of Public Works, announced on October 23 that in future mining concessions granted by his department will include a proviso that the miners shall share in profits. This was reaffirmed on October 26.

##### GERMANY.

**Halle on the Saale, Oct. 22.**—The newspapers state that in consequence of the riotous conduct of the strikers employed by the mining company which is working the Mansfeld copper deposits, the authorities last night despatched three companies of the 35th Regiment of Fusiliers and some companies of the 66th

Infantry Regiment to the scene of the trouble near Kupferhammerhütte. Four machine guns have been placed in readiness for emergencies.

**Berlin.**—With reference to the approaching international conference in Paris to elaborate a mining law for Morocco, the German Mannesmann group has taken the opinion of thirteen authorities on international law in various countries, including Professor Westlake. These are unanimously agreed that the Mannesmann concessions do not come within the scope of the conference, which they consider can only deal with future eventualities. These concessions cover an area amounting to one-tenth of the whole of Morocco and are situated in the Melilla region, beginning 30 kilometres (18½ miles) from the coast. The Sultan, Mulai Hafid, is interested in them, and has already obtained advances from Mannesmanns on the security of his interest.

### TURKEY.

...Constantinople.—Since the re-establishment of the Constitution, in July 1908, no fewer than thirty mining concessions have been granted to private persons, who, with two exceptions (British subjects at Smyrna) are all Ottomans. According to the terms of concession, two years are allowed in which the exploitation of the mine is to commence, failing which the concession is forfeited. The Government derives a benefit varying from 5 per cent. to 20 per cent. (according to the nature of the mineral) on the gross receipts, besides a tax of ten piastres per hectare of the extent of the mine. Work has not yet commenced on any of the new concessions, and a serious drawback to their proper working is the absence of roads. The mines for which concessions have been granted are situated in the vilayets of Aidin, Salonika, Brusa, Dardanelles, Trebizond, Uskub, Adana sandjat of Ismid, districts of Guebze and Kartal, near Constantinople, and comprise the following minerals—arsenic, manganese, argentiferous lead, antimony, copper, chrome, zinc, emery, lignite and iron.

### RUSSIA.

Among the questions now engaging the attention of the Russo-British Chamber of Commerce is the importation into Russia of machinery and instruments for the gold and platinum mining industries. By a decision taken in 1898 such articles were admitted duty free for a period of ten years. In 1908 the Ministry of Commerce declined to renew the privilege, and the gold and platinum industries have now addressed themselves to the Chamber of Commerce in the hope that the exemption of mining machinery from duty may be restored.

### AUSTRALIA.

During the past twelve months the export coal industry from Australia has been in a very depressed condition, and there are at present no signs of any improvement. The cause of the setback is attributable to the quiet state of trade all over the world and the lower prices at which coal has been selling in other countries, which have prevented the Australian collieries from competing in foreign markets. Tangible evidence of the unsatisfactory conditions which have prevailed recently is to be found in the dividend declared by the Scottish Australian Mining Company, which was at the rate of 7 1-2 per cent. per annum, as against 10 per cent. per annum in the first half of 1908. The distribution now declared is, of course, not altogether unsatisfactory, nevertheless, it does reflect the falling-off which has occurred in the company's business, which it is to be feared will make further progress before there is any revival.

**Perth, Western Australia.**—Press despatches dated November 10 bring the news that the surface structures of the Great Boulder gold mines have been destroyed by fire. The damage done is estimated at \$1,500,000.

**Sydney.**—Twelve thousand miners have gone on strike at the Newcastle and Maitland collieries. A general sympathetic strike is expected.

### SOUTH AFRICA.

**Pietermaritzburg, Oct. 25.**—The Natal Mining Commission recommends the establishing of a permanent Board and the granting of increased facilities for prospecting and larger rewards for discoveries of gold.

**Johannesburg.**—The foundations for the mortar boxes of the Randfontein Central mill are completed. The ore-bins will have a 5,500 ton capacity. The excavations for the sands and slimes plant are progressing rapidly.

There has been large buying of Rhodesia, Ltd., on the strength of the reconstruction scheme undertaken by Mr. Abe Bailey.

The Umkondo Copper mine in the Victoria District of Mashonaland, the property of the Consolidated African Copper Trust, upon which active work is proceeding, is opening up well.

The Transvaal Gold Mining Estates (Lydenburg district) are opening up a new reef on Peach Tree Creek, going 26 dwts. over 21 ins. About 10,000 tons have been developed.

The October profits of the Rand mines will make a slightly lower showing, owing to the scarcity of labour and relatively higher costs. An improvement in the labour supply is perceptible.

The improvement in the ore of the central section of the Consolidated Main Reef mine, recently reported, is maintained, and the position and prospects of the company are being steadily enhanced.

De Beers are recommencing work on the Bultfontein and Du-toitspan mines. The public of Kimberley is elated at the immediate prospect of renewed activity and revival in local conditions.

### SOUTH-WEST AFRICA.

A report issued by the German Colonial Economic Committee states that about 80 diamond winning companies have been formed in German South-West Africa, and the shares of about 25 of these undertakings are dealt in on the Bourse at Luderitz Bay. The strong resistance offered to the Regie Company at the beginning has been removed; the questions in dispute seem for the most part to have found a happy solution, although some difficult problems still await a settlement. The Diamond Leasing Company of Berlin has been formed to work the State diamond fields, and the German Diamond Company to work the "close district" of the Colonial Company for South-West Africa. About 50 per cent. of the value of the diamonds found has to be paid as taxes and the cost of production ranges from 2s to 10s per carat, according to local conditions. Since the beginning of activity of the Regie Company at the commencement of March down to the starting of October, 273,701 carats have been delivered, which have yielded \$399,060, of which the sum of \$193,500 has reverted to the State. The prices have gradually risen higher and higher and amounted in the case of the first nine deliveries on the average to 22s 5d per carat, 27s 3d, 27s 6d, 26s 11d, 28s 6d, 28s 1d, 28s 5d, 30s and 33s 8d respectively. At present the monthly output is about 45,000 carats, and it is expected that the monthly average for the current year will attain 45,000 carats.

**Lagos.**—The Government of Southern Nigeria has passed a new Ordinance regulating oil mining. New areas for mining may be notified, but they will be subject to restriction, and the Governor may declare that the holders of a lease are only entitled to drill for oil.

### SOUTH AMERICA.

#### CHILI.

**Santiago de Chile, Oct. 21.**—As a result of borings made by the Government engineers in Southern Chili, in the district between Chilos and the south of the river Paullin, valuable petrol springs have been discovered.

## Company Notes.

The Board of Directors of the operating company, La Rose Mines, Limited, will be constituted as follows: Messrs. Alex. Pringle, president; D. Lorne McGibbon, Shirley Ogilvie, Victor E. Mitchell, K.C., David Fasken, K.C., E. P. Earle, and R. B. Watson, general manager of La Rose Consolidated and Nipissing Mines, Ltd.

The Granby costs per pound of copper produced for the year ending last June, were 10 cents per pound.

The first general meeting of the shareholders of the Amalgamated Gold Mines of Sheep Creek, Limited, took place at Van-

couver on Oct. 30, at the company's offices, 506-508 Hastings Street West, at which organization was completed by the election of the following officers and directors:

President, Mr. F. C. Wade, K.C., Vancouver; Vice-Presidents, Mr. H. G. Neelands, Nelson, and Mr. F. L. Murdoff, Vancouver; Directors, Mr. H. A. Jones, Vancouver; Mr. Thomas Brown, Nelson, and Mr. J. L. Warner, Nelson. Secretary-Treasurer, Mr. D. G. Williams, Vancouver. This company has valuable holdings in the Sheep Creek gold camp.

At the meeting on Nov. 1st the Amalgamated Asbestos directors decided that the dividends on the preferred stock will date from January 1st. The first dividend for the quarter ending March 31st will be paid on April 1st.

**Ore Concentration Company.**—Advice has been received from the Sulitelma Company's mines in Norway that for the ten days ended 10th instant 341 tons of concentrates containing 6.73 per cent. copper, were produced by the Elmore process.

**Dividend No. 17 Kerr Lake Mining Company.**—The Board of Directors on Oct. 15 declared a regular quarterly dividend of four per cent. and an extra dividend of three per cent. upon the capital stock of the company, payable December 15th, 1909, to all stockholders of record at the close of business on December 1st, 1909.

**Le Roi 2** has declared its regular quarterly dividend of two shillings per share, payable Nov. 6.

## STATISTICS AND RETURNS.

The October outputs of the Nova Scotia Steel Co. were as follows: Steel, 7,148 tons; pig iron, 5,640 tons; coal, 77,130 tons.

### COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt Camp for the week ending Oct. 30, and those from Jan. 1, 1909, to date:

| Trethewey .....   | 64,625 1,743,323 |
| T. & H. B. ....   | 1,106,260        |

Ore shipments to Nov. 6 from Jan. 1 are 49,451,376 pounds, or 24,725 tons.

Total shipments for week ending Nov. 6 are 644,790 pounds, or 322 tons.

Nelson, October 23.—The total ore shipments for the week in Southeastern British Columbia amounted to 52,191 tons, and for the year to date 1,507,327 tons. The smelter receipts were 49-336 and 1,389,500 respectively.

This is by far the largest weekly output so far this year, and away over the average. The Granby's tonnage, and that sent to the British Columbia Copper Company's smelter accounts for the very gratifying increase.

#### SOUTH-EASTERN B. C.

The following are the ore shipments and smelter receipts in detail:

##### ORE SHIPMENTS.

| Boundary—         | Week.  | Year.   |

#### TORONTO MARKETS.

##### Metals.

Nov. 9.—(Quotations from Canada Metal Co., Toronto.)  
 Spelter, 6½ cents per lb. (strong).  
 Lead, 3.75 cents per lb.  
 Antimony, 8 1-2 to 9 1-2 cents per lb.  
 Tin, 32 cents per lb.  
 Copper, casting, 13.65 cents per lb.  
 Electrolytic, 13.75 cents per lb.  
 Ingot brass, 9 to 12 cents per lb. (metal market very steady).  
 Nov. 9.—(Quotations from Drummond McCall Co.)  
 Summerlee, No. 1, \$24.00 (f.o.b. Toronto).  
 Summerlee, No. 2 \$23.50 (f.o.b. Toronto).  
 Midland, No. 1, \$22.50 (f.o.b. Toronto).  
 Coal, anthracite, \$5.50 to \$6.75.  
 Bituminous, \$3.50 to \$4.50 for 1 1-4 inch lump.

##### Coke.

Nov. 5.—Connellsville coke (f.o.b. ovens).  
 Furnace coke, prompt, \$2.75 to \$2.85 per ton.  
 Foundry coke, prompt, \$2.75 to \$3.00 per ton.  
 Nov. 5.—Tin (straits), 30.60 cents.  
 Copper, prime Lake, 13 1-2 cents.  
 Electrolytic copper, 12.85 to 13.00 cents.  
 Copper wire, 14.50 cents.  
 Lead, 4.40 to 4.42 1-2 cents.  
 Spelter, 6.40 cents.  
 Sheet zinc, 8.50 cents.  
 Antimony, Cookson's, 8.37 1-2 cents.  
 Aluminum, 23 to 24.00 cents.  
 Nickel, 40.00 to 49.00 cents.  
 Platinum, \$28.50 to \$32.25 per oz.  
 Bismuth, \$1.75 per lb.  
 Quicksilver, \$50.00 per 75-lb. flask.

| " 8 .....        | 50¾ | 23¾     |

New York, November 2.—A large sale of copper, said to amount to 30,000,000 pounds, has been made by the United Metals Selling Company, the selling agents of the Amalgamated Copper Company, it was learned to-day and negotiations for still further sales of the metal are under way.

The price is believed to have been a fraction under 13 cents per pound, for electrolytic, or high grade metal.

The recent over-production of copper has caused no little concern among the trade, and to-day's news was regarded as an important advance toward the restoration of better conditions in that branch of the metal industry.

## Volumes III and IV

Per Volume \$5.00 [21s] Net Postpaid

The Set, 4 Volumes, \$20.00 [£4 4s] Net Postpaid

NOTICE- The index for all four volumes will be issued separately and supplied free at an early date to all purchasers of Volumes III and IV.

It required two large volumes to cover the new machinery, processes, discoveries and data in ore dressing. These volumes supplement but do NOT SUPPLANT I and II.

In general arrangement Volumes III and IV are similar to Volumes I and II. The Chapters are each intended to supplement the subject-matter of the corresponding chapters in the earlier volumes, describing new machines, new processes, and giving new data. The greatest care has been exercised in avoiding repetition.

Since the issue of the earlier volumes, many important discoveries have been made and radical departures introduced in established processes. Volume III, for example, has complete discussions of fine grinders, particularly the tube mill and grinding pans, rectilinear tables of the Wilfley type, the questions of magnetic separation, electrostatic separation, the flotation processes, and other subjects of like importance not covered in the earlier volume.

When Volume I was issued, the tube mill, which has almost revolutionized gold and silver milling practice, was

hardly touched upon. The Wilfley table was just finding its place among mills, and a number of other tables of the same type have been developed since.

Volume IV describes in detail some 94 complete mills, showing the most approved modern and successful methods of applying ore-dressing principles in use to-day throughout the mining districts of the world. Comparisons are made with earlier descriptions to show modifications and improvements, and to point out errors in older plants.

Throughout both volumes, much space and great care have been devoted to the general subjects of costs of operation, speed, capacity, water power, life of machines, etc. Power and water plants are described in connection with nearly every mill.

Complete Bibliographies are added. The Index for the entire four volumes has been remade and will be bound separately. It will be furnished without charge to purchasers of Volumes III and IV.

Book Dept. Canadian Mining Journal - Toronto

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

HALF CALF - \$7.50

**Book Dept. Canadian Mining Journal - - Toronto**

CANADA.—DEPARTMENT OF MINES.**GEOLOGICAL SURVEY****PUBLICATIONS**

The Geological Survey has published maps and reports dealing with a large part of Canada, and with many local areas and special subjects.

**MARITIME PROVINCES**

The whole of Cape Breton, and a large portion of the coal and gold fields of Nova Scotia, have been reported upon, and mapped on a scale of 1 mile to 1 inch. The remaining portions of the Province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter Provinces, mapped on a scale of 4 miles to 1 inch.

**QUEBEC**

Quebec, south of the St. Lawrence, has been reported upon, and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the Province north of the St. Lawrence are also available.

**ONTARIO**

A large part of the Province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

**THE PRAIRIE PROVINCES**

Geological maps and reports have been issued covering the greater part of the Provinces of Manitoba, Saskatchewan, and Alberta.

**BRITISH COLUMBIA**

The southern portions of British Columbia, as well as other parts of the Province, have been reported upon and mapped.

**YUKON**

Many of the important areas in the Yukon have been reported upon and mapped.

**THE NORTH WEST TERRITORIES**

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost, and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

*Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

**THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:****CANADA**

1084. General Geological Map of Canada. Scale 100 miles to 1 inch.

**NOVA SCOTIA**

1019. City of Halifax Sheet.  
1025. Waverley Sheet.  
1037. Windsor Sheet.

The above sheets belong to the regular series of Nova Scotia map sheets on a scale of 1 mile to 1 inch. The first includes Halifax City and Harbour, the second the Waverley Gold District, and the third Gypsum Quarries.

**ONTARIO**

1023. Geological Map showing position of Corundum-bearing rocks in Central Ontario.  
1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

980. Portion of Algoma and Thunder Bay districts, Ontario, 1908. W. J. Wilson.  
1081. Region lying north of Lake Superior between the Pic and Nepigon Rivers, Ontario, 1906. W. H. Collins.

**BRITISH COLUMBIA**

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shows the geology and location of veins.

1004. Geological Sheet, Rossland Mining Camp. Scale 1200 feet to 1 inch.  
1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch.

**YUKON**

1041. Geological and Topographical Map of Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of same belt.  
NOTE.—Maps recently published may be had on linen cloth, for use in the field, at 10c. per copy.

**REPORTS**

1072. Summary Report of the operations of the Geological Survey for year 1908.  
1085. Descriptive Sketch of the Geology, and Economic Minerals of Canada. G. A. Young. Introduction, R. W. Brock.  
1075. Gowganda Mining Division, 1908. W. H. Collins.  
1035. Coal Fields of Manitoba, Saskatchewan, Alberta, and Eastern British Columbia, 1908. D. B. Dowling.  
1050. Whitehorse Copper Belt, Yukon. R. G. McConnell.

**NEW CATALOGUE**

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite ; copper in sulphide and native form ; gold, mostly in free milling quartz ; silver, native and in other forms ; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are : Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc ; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows :

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

**Miners' Certificates** good for a calendar year may be obtained by sending \$10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of \$10.00 plus a yearly rental of \$1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed

territory may be purchased as a mining concession at the price of \$20.00 per acre if within 20 miles of a railway in a straight line, or \$10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

**The Hon. Minister of Colonization, Mines and Fisheries  
Quebec.**

## Province of Nova Scotia

**Leases for Mines of Gold, Silver

**An Accurate Ore Test**  
on any metal in 10 minutes  
**For Five Cents.**

That's what the Mining Man or Prospector can have, provided he has a Way's Pocket Smelter Outfit. Anybody can make his own tests right in his office or in the field on **any ore**. Think of what this means to a prospector "miles away from nowhere" or to the mining man who must make dozens of tests a day.

Write for folder giving full information about **Way's Process** and describing both field and laboratory outfits.

**WAY'S POCKET SMELTER CO.**  
Box 954, South Pasadena, Cal.

# Mining Companies

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing, and distributing Annual Statements, Special Reports, Descriptive Pamphlets, Prospectuses, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction. We are making a specialty of engraving and printing bonds, stock certificates, professional and business stationery, business cards and all such work. Orders from mining districts will receive prompt attention.

We shall be glad to furnish estimates to enquirers.

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver; \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals; or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,039 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

**Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.**

*When answering Advertisements please mention THE CANADIAN MINING JOURNAL.*

## The Crow's Nest Pass Coal Co. LIMITED

### OFFICES

**Manning Arcade, Toronto**  
**Fernie, British Columbia**

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

**Our Analyses Speak for Themselves.**

**CHAS. SIMISTER,**  
General Superintendent.

**J. D. HURD,**  
General Manager.

## WHY IS IT

THAT SALES OF

**MORTON'S**

**" B C "**

## Drill Steel

ARE INCREASING EVERY DAY?

MUST BE IT IS BETTER MATERIAL,

**Gives Best Satisfaction**

AND THE DRILL

**Lasts Longer.**

**COULD ANYONE EXPECT MORE?**

IN STOCK WITH

**E. G. PRIOR, Victoria, B.C.**

**CANADIAN RAND CO., Cobalt.**

**BAINES & PECKOVER, Toronto.**

**ANGEL ENGINEERING & SUPPLY Co.**  
**St. John, Nfd.**

*Canadian Representative*

**D. W. CLARK, P.O., Box 521, Toronto.**

## The Longest Continuous Double Track Railway in the World Under One Management.

### The Great Double Track Route Through Canada.

Fast passenger service from the Atlantic Ocean to the head of the Great Lakes. The line taps all the principal commercial centres in Canada and reaches the important points in the States of Maine, New Hampshire and Vermont, the principal towns and cities in the Provinces of Quebec and Ontario, and many important places in the States of Michigan, Indiana and Illinois.

## The "International Limited" (Canada's Railway Greyhound)

### The Finest and Fastest Train in the Dominion

Runs every day in the year leaving Montreal at 9.00 o'clock in the morning for Toronto, Hamilton, Niagara Falls, Buffalo, Detroit, Chicago and intermediate points.

Write for copy of "Trains 3 and 4" descriptive of the route from Chicago to the sea, to J. Quinlan, Bonaventure Station, Montreal, or to J. D. McDonald, Union Station, Toronto.

**W. E. DAVIS,**  
Passenger Traffic Manager,  
MONTREAL.

**G. T. BELL,**  
Assistant Passenger Traffic Manager,  
MONTREAL.

**GEO. W. VAUX,**  
General Passenger Agent,  
MONTREAL.

# The Canadian Miner's Buying Directory

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch, and, in writing advertisements, are giving, not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisements, kindly mention this Journal.

2369 Montreal

Manufacturers of

## Steel Castings

(Acid Open Hearth System)

## Switches and Track Work

for Steam and Electric Roads

## Springs

of all kinds

## Manganese Steel Castings

for wearing Parts, insuring Great  
Hardness and Durability

INTERLOCKING PLANTS

TRUCKS FOR ELECTRIC CARS

AGENTS FOR CANADA FOR

**THOS. FIRTH & SONS, LIMITED, SHEFFIELD, ENGLAND**

"Speedicut" High Speed Steel, Tool Steel, Axe Steel, Saw Steel, Files, etc. A large stock carried in our warehouse

**BARROW HAEMATITE STEEL CO., BARROW-IN-FURNESS, ENGLAND**

Quotations for Tee Rails, Fish Plates, etc., promptly furnished.

Catalogues sent on application.

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

General Passenger Department, Intercolonial Railway  
MONCTON, N.B.

# Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

## Canadian Westinghouse Co., Limited

General Office and Works, HAMILTON, ONTARIO.

Traders Bank Bldg.,

## HAMILTON POWDER COMPANY

Head Office: 4 Hospital Street, Montreal

MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and  
Sporting Powder, etc.

Safety Fuse, Electrical Fuses, Batteries, and other  
Accessories.

### NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

### "WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

### "AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

### PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

COBALT      TORONTO      KENORA      WINNIPEG, MAN.

# Behrend Concentration System

## Combination WET and DRY

A complete recovery from all slimes and minerals such as Graphite, Galena, Stibnite, Chalcopyrite, Tetrahedrite, Sylvanite, Molybdenite, Stephanite, Argentite, Ruby Silver and and Native Silver.

This system will make low grade deposits pay. Every mine having an eye to business should investigate this system which has the approval of leading mining authorities.

A completely equipped plant, including concentrators, crushers, rolls, etc., for testing purposes is located at address below. Forward a sample of your ore for preliminary test.

## Carbons

(Black Diamonds) for Diamond Drills

Largest carbon ever found.  $\frac{1}{4}$  actual size.

NOTE. We personally break (in this country) our carbons, thereby enabling us to determine accurately their quality. We deal only in very best quality and are always ready to ship goods on approval and for selection to responsible parties. Write us.

## A Lesson in Economy

There are Rock Drills on the market to-day that at first appear a little lower in price than our machines, but when the matter of efficiency, durability and economy is taken into consideration, they cost, in the long run, from 25 to 35% more. We are prepared to back up our contention in this respect by actual facts. A thorough trial will convince you of the merit and economy of our tools. Write us for catalogue No. 27 descriptive of our many different devices for the development of mining claims.

### THE COAL-STEEL MERGER.

All things work together for good. Possibly this dictum needs no restricting clause. The foolish squabble between the Dominion Iron & Steel Company and the Dominion Coal Company has been the direct cause of the pending amalgamation of these two huge enterprises—a dramatic climax to the litigious burlesque.

The first newspaper rumours of the merger were received with incredulity. Gradually, however, it became evident that Mr. James Ross, president of Dominion Coal and the largest individual stockholder in both companies, was prepared to retire from his commanding position. Mr. Ross, in whom there is concentrated much more than one man's share of pluck and pugnacity, made his own terms. But before touching on these particulars it may be well to review the physical assets and the financial standing of both companies.

The Dominion Coal Company commenced operation in 1893. The company's property comprises the greater part of the rich Sydney, Cape Breton, coalfield, the area of which is about 250 square miles. It also holds other coal land in neighbouring districts, including twenty-five square miles of submarine coal areas near Point Aconi. An estimate of the coal contents of the Dominion Coal Company's lands, made six years ago, places the total at 1,435,360,000 tons. Nine collieries, several of which are among the best equipped coal mines on the continent, contribute to the production of about 3,500,000 tons per annum—nearly half the total production of Canada. The company operates about 100 miles of railway, which is amply provided with rolling stock. It also owns a half interest in the Sydney and Glace Bay Electric Railway.

In addition to its complete establishments in the Glace Bay district, the Dominion Coal Company owns a system of loading piers at Sydney, Glace Bay, and Louisburg harbours, a fleet of ten colliers, a wrecking plant, and large modern discharging plants at St. John, N.B., and at Three Rivers, Quebec, and Montreal. The company also employs between 15 and 20 foreign-owned steamers.

The market area over which the output of the Dominion Coal Company is distributed embraces eastern Canada as far as Montreal, the island of Newfoundland to the east, and Boston to the south. Shipments are occasionally made to the West Indies. The collieries are ideally situated as regards ocean trade. Their position is, and will remain, commanding.

Ground was broken at Sydney, N.S., for the works of the Dominion Iron & Steel Company on August 10th, 1899. The winter and spring of 1901 saw the completion of the works as originally designed, comprising 400

by-product coke ovens, four blast furnaces, and ten open-hearth steel furnaces, together with the necessary accessory equipment.

The construction period, 1899 to 1902, was marked by prodigal expenditure. So reckless, indeed, was the outlay of funds that the company was in a very critical condition when, in the spring of 1903, the administration was changed and the management placed in the hands of Mr. Graham Fraser, with whom was associated his son, Mr. J. Dix Fraser. Radical economies were now effected, large additions were made to the plant, and, principally through the practical common-sense of Mr. Fraser, the enterprise was put on a sound footing. The additions to the steel plant made it possible to enter the Canadian market, and the Dominion Steel Company became what it is to-day, a Canadian industry.

The present plant, which is constantly being enlarged, consists principally of 500 by-product coke ovens, four blast furnaces, two Bessemer converters, one hot metal mixer, ten open-hearth steel furnaces, one blowing mill, one continuous billet mill, one rail mill, one rod mill. Subsidiary plants for the manufacture of chemicals and cement have been erected on the company's ground by other interests.

The history of the relations of the Dominion Steel Company to the Dominion Coal Company has been referred to frequently in these columns. It is sufficient to state here that until the reorganization of 1903 the Steel Company held a vague contract with Dominion Coal for "an assured supply of coal, on favourable terms and for a long period of time, for the use and benefit of" the Steel Company. By the terms of this contract the Steel Company had the right to lease and operate the Coal Company's properties, should it decide to do so within a certain specified time. A new and more reasonable agreement was entered into in 1903, whereby the Dominion Steel obtained suitable fuel on much more advantageous terms. The interpretation of this latter agreement was the crux of the litigation lately settled.

Previous to 1902 the Dominion Iron & Steel Company's bonded indebtedness was \$8,000,000; its preferred stock, \$5,000,000, and its common, \$15,000,000—a total of \$28,000,000. At that time the Dominion Coal Company's capital liabilities were as follows: Common stock, \$15,000,000; preferred stock, \$3,000,000; first mortgage bonds, \$2,801,500; total, \$20,801,500.

During 1902 the common stock of Dominion Iron & Steel was increased by \$5,000,000, and second mortgage bond issue of \$3,000,000 was made. Of the bond issue one-half was taken up at par by the directors.

The legal victory in its dispute with Dominion Coal put Dominion Steel, temporarily at least, in a fair position. In a later issue we shall examine this position more closely.

The Dominion Iron & Steel Company's total stock and bond issue stands now at \$34,368,833. Its gross earning capacity is about \$3,000,000 per year.

The Dominion Coal Company's total stock and bond issue is \$23,000,000. In earning capacity it far exceeds the Steel Company. Its administration is most efficient, its plant thoroughly efficient, and its departments highly organized.

The above rough sketch is designed merely to give our readers a conception of the magnitude of the two members of the proposed merger.

Of the merger, provided there is no injection of water, Canadians will approve. Undoubtedly it should facilitate the business of both concerns.

It is appropriate, however, to ask a leading question: Can the Coal Company, which has incurred heavy bonded indebtedness to insure a certain output the profits from which will meet present fixed charges, at the same time set aside a fund from its lessened earnings for the redemption of these bonds? Can it, further, provide out of these same earnings for the costly development of new mines?

It is only fair to ask these questions. Modern financiers have a characteristic tendency to ignore the underlying physical difference between mining and manufacturing. Mining is a venture in which money is made by the destruction of assets. Countless billions of tons of coal are worthless unless they can be mined at a net profit.

### RECENT COLLIERY DISASTERS.

The folly of using naked lights in coal mines continues to be exemplified by explosions and fires, both on this side of the Atlantic and on the other, attended by a wicked waste of human life. The newspaper despatches do not give a very clear idea of what actually happened at the appalling catastrophe in Illinois, but it is beyond a doubt that the fire originated through the criminally careless use of naked lights underground. The loss of 30 lives at the Darren colliery of the Rhymney Steel Company in Wales on the 29th of October is referred to in the Western Mail as follows:—

"Comparatively little damage was done to the workings, and to those who have a long experience of the Darren colliery the cause of the explosion is quite inexplicable. As a house coal colliery it has always been looked upon as the safest of pits, no gas having ever been detected there. In proof of this it may be stated that naked lights were used, and not safety lamps. The theory which finds most favour among experts and experienced miners is that through a rather heavy fall a quantity of gas was released, and this, being ignited by one of the naked lights, caused the explosion."

We may assume, therefore, that if safety lamps had been in use the disaster would not have occurred. It may also be safely assumed that when the mine is re-started safety lamps will be used.

The Darren explosion was marked by heroism of a kind remarkable even in the long roll of brave deeds that have attended colliery disasters in Britain. No less than five men gave their lives for their fellows in an unavailing attempt at rescue, and eight others were brought to bank in an unconscious state. The manager, the underground manager, and three other officials comprised the group of heroes who died in the work of rescue. The whole account of this disaster is such as to stir the blood and to make us feel that "gallant Wales" is still the mother of brave sons.

The other matter that is exemplified by these two disasters is the proper use of oxygen breathing apparatus. These devices were brought into use at both places. At Darren the rescue corps from the Aberamen Station arrived too late for the work of rescue. The explosion occurred at 4 a.m., and not until evening did the apparatus arrive at the colliery. But had trained men with proper equipment been on the scene at Darren when the blast occurred, the tale of rescue might not have been so gloomy. In saying this we would carefully guard against any suggestion of minimizing the work done by the rescuers. They gave their lives, and no man can do more than that. But brave men should not be permitted to imperil themselves amongst the deadly gases that follow a mine explosion, when science has provided a remedy.

At the Cherry mine, so far as one can learn, the breathing apparatus of the U. S. Geological Survey station has been used to good effect in preparing the way for the firemen and restoring the ventilation. Here again, however, had the apparatus been immediately available with a sufficient number of trained men, life might have been saved. Of this feature more exact details will enable a better judgment.

The following extract from a letter written by the superintendent instructor of the Aberamen Station is pertinent. He writes:—

"After the dead bodies were brought up on Saturday morning [at Darren] I received another wire at Deri, requesting us to go at once to Penrhewceber with our apparatus, as the pit was on fire and all the men below. So we hurried away to this place, and reached there early on Saturday morning, where we did some very good work. The fire had got up above the archwork, and seeing that we had a lengthy task before us, I arranged that the brigade should work in relays, to enable the men to get some rest. By Tuesday morning we had the fire practically out, and the men had worked well indeed. Once again the Draeger helmet proved a great success. I may mention that with the experience we have had, an apparatus without a helmet would have been of no use whatever. The helmets protected our faces from the steam given off."

At another colliery in England an outburst of gas

occurred in the workings, and the mine was cleared of the accumulation by men wearing helmets. Had this mine not been using safety lamps the helmets might have been required for a sadder task.

The points we wish to make are, first, that safety lamps should be used in all coal mines whether they are reputed "gassy" or not. Most of the dreadful explosions that have occurred in recent years have been at mines with a reputation for "safety." The Courrieres Mine, the Darr, the Monagahela, and the Cherry Mine, all were mines with a reputation for "safety." The use of naked lights is foolish and wicked.

The second point is that breathing apparatus for rescue work and fire-fighting in mines is valuable if it is immediately available. It may be compared exactly to other fire-fighting equipment. The usefulness of a fire brigade, everyone knows, depends more upon the rapidity with which a call can be answered than upon anything else. So with mine rescue apparatus.

Another interesting feature of the Darren explosion was the use of oxygen in reviving unconscious persons suffering from poisoning by fumes. One of the rescuers, a doctor, lay in the after-damp for over five hours, and he was given up for dead. When he was brought to the surface oxygen was administered, and after a long interval, the doctor regained consciousness, and was last reported as progressing favourably.

## THE GEOLOGICAL SURVEY AND PARLIAMENT

The work of any government department, to produce adequate results, must not be subject to extraneous interruptions nor to undue political influence. Ideally, political influence should be entirely absent.

The Geological Survey, under its present administration, has been effectively removed from the sphere of partisan interference. In accomplishing this, both the Minister and the Director have shown a fine disregard of "pull" and "privileges." Comment and commendation are superfluous. The situation speaks for itself.

The warmest admirer of the Survey will not claim that it is perfect. There are manifest weaknesses and discrepancies in the organization. But these weaknesses and discrepancies are not inherent. They arise altogether from the fact that the Survey is crippled financially. Its total appropriation has always been insufficient. Every year the demands upon the Survey have increased. Every year has seen the appropriation become more and more inadequate.

Now, there are two fundamental essentials without which the Survey would rapidly lose all meaning. First, its staff must be composed of capable, specially trained, professional workers. Men of the proper

type are hard to secure, and harder to retain. The salaries paid by the Survey are very much smaller than those offered by private corporations. Hence the only inducements that the Survey can offer are the honorable standing and the professional distinction that accrue to its servants. Without these inducements only the riff-raff of the profession could be engaged. Political office-seekers and their champions, if given any encouragement, could readily deprive the Survey of all chance of retaining first-class men.

The second desideration is a corollary of the first. Briefly, it is imperative that the Survey continue to enjoy the fullest confidence of mining men and investors. Without this confidence it would be out of the question for the Survey to attempt much of its most important work. Free access to mines and to records is necessary. This cannot be demanded. It is given only when private corporations know that confidences will not be betrayed.

At present the staff of the Survey is composed of men who rank with the best in any corresponding body anywhere. To a remarkable degree their reports are economic. The whole point of view of the Survey is coloured by the needs of the mineral industries. The officers of the Survey are active members of the Canadian Mining Institute. They are constantly in touch with mining problems.

It is also unqualifiedly true that the Survey enjoys the implicit confidence of the mining fraternity. This is a precious asset, an asset that must be guarded with utmost care. An irresponsible utterance in the House of Commons, baseless, irreparable criticism of a disappointed grafter, can do damage.

In short, the Survey has struggled and is struggling against almost insuperable obstacles. In spite of this it has been brought to a state of high efficiency.

What is least needed, what would most effectually injure the whole fabric of the Survey's credit, is hostile attention from members of Parliament. On the other hand, intelligent inspection will always be welcomed. And intelligent inspection of the Survey's work and methods will convince any impartial person that it is organically wholesome, clean and vigorous.

The Survey is doing its duty. Parliament has not done, is not doing, its duty in respect of the Survey.

### THE COALFIELDS AND A CANADIAN NAVY.

The question of a Canadian Navy has evoked many varied expressions of opinion in the public press of late, but one thing on which everybody should agree is the vulnerability of our shores to attack by an unfriendly nation. Probably at no place on the eastern seaboard of Canada could an enemy do more damage in a shorter time than in that bit of our coast that lies between Louisbourg and the Great Bras d'Or Entrance on either side of Sydney Harbour. Viewed from the three-mile limit at sea on a clear day, the Sydney coalfield presents

a striking picture, for between the old Gowrie mine and the new No. 3 Colliery of the Nova Scotia Steel & Coal Co. one can count over a dozen columns of smoke, each of which indicates a flourishing colliery, representing in each instance a capital expenditure of from \$250,000 to \$2,000,000. The spectator may recognize the tall chimney of No. 6 Colliery, the imposing bulk of No. 2 bankhead, the smoke of the new collieries at Lingan, and the typically English appearance of Old Sydney Mines No. 1.

Every one of these mines is within easy range of the batteries of a modern battleship, and half an hour's good practice with 12-inch guns would suffice to set every mine on fire and do irreparable damage. An enemy who desired to effect an occupation of these mines would not, of course, perpetrate such wholesale damage, but the enemy who fears the vengeance of a swiftly following British squadron will certainly choose this exposed and valuable outpost of Canada as one where a bombardment would serve the double purpose of working terrific destruction and of crippling the national coal supply. Summer after summer the residents of Sydney see the warships of foreign nations lie at anchor in Sydney Harbour, and in the piping times of peace their presence adds to the picturesqueness of a magnificent and spacious harbour. But in time of war, with a hostile "Dreadnought" in the offing and the British fleet at grips anywhere from Kiel to Vladivostok, what could the harbourmaster of Sydney do? He would be a foolish admiral that attacked the fortress of Halifax when the unprotected port of Sydney offered him a place to coal and refit, and nothing to say nay except the laughable equipment of the local militia artillery. The shareholders of the Dominion Steel and Coal Corporation need scarcely debate with themselves the advisability of a Canadian contribution to the naval expense of the Empire. The fleet that guards the Medway and the Solent guards also the dividends of Coal and Steel, and the coal supply on which the industrial activities of the eastern half of this Dominion chiefly depend.

### STABLE STARCH SOLUTION FOR VOLUMETRIC ANALYSIS.

One of the messy little troubles against which the metallurgical chemist must contend is the difficulty of making up a clear starch solution. The following formula, devised by Mr. A. H. Low, does not deteriorate, and remains clear, giving a satisfactory indication of the end-point in the iodide copper assay: After making up and filtering a cold saturated solution of commercial sodium chloride in distilled water, take 500 c.c., add 100 c.c. of 80 per cent. acetic acid and 2 grains of starch; Mix cold. Boil until nearly clear, or about two minutes. The starch is now entirely dissolved, and no filtering or settling is required. The starch may be used when cool.

# REPORT ON THE WHITEHORSE COPPER BELT YUKON TERRITORY

By R. G. McConnell.

Issued by the Geological Survey Branch, Department of Mines, Ottawa—Abstract Prepared for the  
Canadian Mining Journal.

## Historical.

The history of the Whitehorse copper belt dates back to the early Klondike rush. Discoveries of copper croppings are reported to have been made by miners on their way to Dawson in the summer of 1897. The discoverers were hunting at the time, and the croppings were not located.

The credit of staking the first claim is due to Jack McIntyre, who located the Copper King, July 6, 1898. The Ora, a neighbouring claim, was staked by John Hanly on the same day. Later in the same year the Anaconda was staked by W. A. Puckett, and the Big and Little Chief by Wm. McTaggart and Andrew Oleson. In the following year the district was pretty thoroughly prospected on the surface, and most of the important claims, including the Pueblo, Best Chance, Arctic Chief, Grafter, Valerie, War Eagle, and numerous others, were discovered and staked.

In 1899, trails were constructed to several of the claims from Whitehorse, and development work was commenced on the Copper King, Anaconda, and Pueblo. Among the noteworthy events of that year was the bonding of the Pueblo, and a group of adjoining claims, to the British America Corporation. The bond was thrown up in 1901, after the completion of 235 feet of sinking and drifting, through what has since proved to be a lean, if not the leanest portion of the lode. No further mining was attempted on this claim until 1906.

The early development on the Copper King was carried out by McIntyre and Granger, the owners, and consisted in sinking on various surface croppings. In 1900 a small shipment of ore, the first from the district, was made from this claim. The shipment was made up of nine tons of rich bornite ore, and is stated to have yielded 46.40 per cent. of copper. A second shipment of 460 tons of high grade ore was made in 1903.

Other claims on which serious attempts at development were made in the early days of the camp are the Arctic Chief, Anaconda, Valerie, and Grafter. Work on the large magnetite ore body of the Arctic Chief was commenced in 1902, and has been prosecuted at intervals ever since. A shipment of 170 tons of selected ore was made in 1904. A small shipment was also made from the Valerie in 1903, the only ore so far from the southern portion of the camp. The early Grafter workings consisted of about 200 feet of sinking and drifting, and those on the Anaconda of about 300 feet of drifting.

Little progress was made during the year 1904-5, and the work done was practically limited to that required to hold the various claims. The rising price of copper in 1906 revived interest in the camp, and a number of the most promising claims were sold or bonded to individuals or companies. During the past season active development work was in progress on the Pueblo, Grafter, Arctic Chief, Best Chance, Copper

King, War Eagle, and Valerie, and small amounts of exploratory work were done on a number of other claims extending all along the belt.

The total amount of development work so far done in the district, including that of the past season, does not exceed 3,500 feet, and the total shipments to various coast smelters aggregate about 4,000 tons. This slow progress in a camp containing so many favourable showings is remarkable, and is attributed mainly to delay in providing proper transportation facilities. Most of the important mines are situated at distances of from four to seven miles from the present terminus of the White Pass Railway at Whitehorse, and are connected with it by wagon roads constructed by the territorial government. The transportation charges to Whitehorse by wagon amount to from \$3 to \$4 per ton, and from Whitehorse by rail and steamer to the various coast smelters to \$6 per ton. The large iron ore bodies on which the camp principally depends, are all comparatively low grade, averaging about four per cent. in copper, and the margin of profit on the ores under present conditions is small.

A spur line from the main line of the White Pass Railway has now been located along a portion of the copper belt, connecting closely with the principal mines, and cheaper transportation in the immediate future is assured. A large tonnage, probably half a million tons, is in sight at the various mines, as a result of recent development work, and extensive shipments are contemplated when the spur is completed.

## Situation and Communication.

The Whitehorse copper belt is situated in the southern part of the Yukon Territory, about 45 miles north of the British Columbia boundary, and extends along the valley of the Lewes River—the principal feeder of the Yukon—for a distance of about 12 miles. The town of Whitehorse, the distributing point of the district, is distant 110 miles from Skagway, at the head of Lynn Canal, one of the numerous west coast fiords. Easy communication with the coast is afforded by a well-built narrow-gauge railway, constructed across the Coast range to Lake Bennett in 1898-9 to facilitate transportation to the Klondike. In 1899-1900 the road was extended down Lake Bennett to Carcross, where it leaves the present waterway, and follows a wide parallel valley, now occupied for some distance by the Watson River, to Dugdale. Here it rejoins the Lewes Valley, and continues down it to the present terminus at Whitehorse, a mile below the Whitehorse Rapids.

Whitehorse, in addition to being the terminus of the railway from the coast, is also the head of navigation on the Yukon. In the summer season, lasting about five months, steamers sail regularly for Dawson, a distance of 450 miles, connecting there with larger steamers, which descend to the sea, a distance of 1,572 miles. In

the winter season communication is kept up by means of stages.

### Topography.

The main feature in the topography of the district is the great valley of the Lewes River. Opposite Whitehorse the valley has a width, from base to base of the enclosing hills, of fully four miles. It is bordered on the east by Canyon Mountain, a long symmetrical limestone ridge, rising to a height of 2,500 feet above the valley bottom, and 4,730 feet above the sea. The western boundary is more broken, and consists, from south to north, of the Golden Horn, a prominent peak 5,400 feet in height; a wide irregular ridge culminating in Mount McIntyre,\* 5,200 feet, and Mount Haeckel, 5,318 feet in height. These elevations are separated by wide drift-filled depressions, extending across the range.

The central portion of the old pre-glacial valley is floored with silts and boulder clays, and through these the Lewes has cut the narrow, winding secondary valley, about 200 feet in depth, in which it now flows.

The surface of the old valley rises gradually from the edges of the secondary valley to an elevation of about 600 feet at the bases of the enclosing ridges. It is rough and exceedingly varied in character. Small plains underlaid by silt alternate with rolling boulder clay hills and ridges, and these in turn are replaced at many points by areas of low, hummocky, granite hills; and near Hoodoo Creek by small cliff-bordered basalt plateaus. Short terraces occur frequently, but do not form continuous conspicuous lines along the valley.

A feature of the old valley bottom is the number of small canyon-like valleys, from fifty to a hundred feet or more in depth, which incise its rocky floor in all directions. Some of these carry the present drainage from the hills, while others are waterless, or enclose small drainless lakes, and were evidently carved out by temporary Pleistocene streams.

The streams of the district, with the exception of the Lewes River, are all small. The most important are Wolf, Hoodoo, McIntyre, and Porter Creeks. The derangement of the drainage system during the glacial period, and the partial deflection of the streams from their old courses, is illustrated by the varied character of their valleys. These are sunk through drift, and are wide and irregular where the pre-glacial channels are followed, and after leaving them become narrow rocky gorges.

The Lewes River, like the smaller streams, failed in places to regain its old channel after the disappearance of the ice. Above Whitehorse it swings to the west, away from its old course, and has sunk a new channel, several miles in length, through the basalt sheet which here underlies the drift. Miles Canyon, and the Whitehorse Rapids, with the intervening stretch of rapid water, are the results of this deviation. Above, and below these obstructions to its navigation, the Lewes widens out, and flows tranquilly along a valley excavated entirely in drift.

### Forest.

The wide bottom lands of the Lewes Valley, in the vicinity of Whitehorse, and the lower slopes of the bordering ridges, are clothed everywhere, except on a few dry hillsides and where fires have passed, with an

almost continuous and moderately dense forest growth. Ascending the slopes the trees become dwarfed and scattered, at an elevation of 1,700 feet above the river, or 3,800 feet above the sea, and 500 feet higher up cease completely. The upper slopes of the higher peaks and ridges are bare.

Timber for mining purposes is plentiful at present, notwithstanding the numerous destructive fires which have ravaged the district, and the supply in the immediate vicinity of most of the principal claims is ample for some years to come. When this becomes exhausted, the needs of the camp can easily be supplied from the forested valleys of the Upper Lewes and its tributaries.

### Waterpower.

The Lewes River, four miles above Whitehorse, contracts and flows rapidly through Miles Canyon. The canyon has a length of 3,000 feet. Below it the river widens out, but continues swift down to the Whitehorse Rapids, distant 2.75 miles from the head of the canyon. The fall of the river in the canyon is 16.2 feet, in the Whitehorse Rapids 9.5 feet, and in the whole stretch of rapid water 49 feet. Additional fall, if necessary, can easily be obtained by damming the river at the head of the canyon. Its width here is about 90 feet, and it is enclosed between nearly vertical basalt walls.

The Lewes River, according to measurements made by Mr. A. J. Beaudette, territorial mining engineer, has a flow at this point of about 135,000 miner's inches at ordinary stages of the water, and with even a moderate head, is capable of furnishing a large horsepower.

A second possible source of water is from Fish Lake, a sheet of water six or seven miles in length, situated in a high valley west of Mount McIntyre, at an elevation of about 1,450 feet above Whitehorse. Fish Lake discharges at present into the Takhini River. The pre-glacial outlet probably followed the depression between Mount McIntyre and Mount Haeckel, leading into the Lewes Valley; now drained by a branch of Porter Creek. The elevation of this pass, measured roughly with the aneroid, is less than that of the lake. The outlet of Fish Lake has a steep declination, and in the early summer months is a large, swift stream. Later on, the flow decreases rapidly, and at the end of September does not exceed 1,500 miner's inches. A large constant supply from this source can only be obtained by impounding the spring floods in the lake.

The streams crossing the Lewes Valley from the bordering mountain ranges, with the possible exception of Wolf Creek, are all too small to be used for power purposes.

### Mining Conditions.

The Whitehorse ores at present are shipped for treatment to the various coast smelters. Transportation charges from the mines to the smelters by wagon, rail, and steamer, amount to from \$8 to \$10 a ton. These charges, as stated in a previous page, will be materially reduced when the branch line along the belt from the White Pass Railway is completed. The ruling smelter charges for the siliceous ores are \$1.50 per ton, with a deduction of 1.3 per cent. of copper for loss. The iron ores, with a high excess of iron, receive more favourable treatment.

Wages in the district are not much higher than in British Columbia. Hand miners receive from \$3.50 to \$4 per day with board for eight hours' work, labourers \$3.50 for ten hours, carpenters and blacksmiths, \$4 to \$5, and engineers \$5 to \$6 per day. Supplies of all

\*Named after Jack McIntyre, the first claim-holder in the district. It has been called Mt. Granger, but this name is used by Mr. Cairnes to designate a mountain near Coal Lake, only a few miles away.

kinds are expensive, owing to the high inward freight rates of from \$50 to \$60 and upwards per ton.

Mining expenses are variable, and depend upon the character of the ore body and accessibility to Whitehorse. With the exception of pumps and steam hoists, no machinery has so far been installed. The altered garnetized rock usually encountered is hard, but breaks readily. Drifting with hand drills usually costs about \$15 per foot, and sinking from \$30 to \$40 per foot. The total cost of ore extraction in the large iron masses is not expected to exceed \$1 per ton.

#### Climate.

The climate at Whitehorse, notwithstanding the high latitude of 60° 45' N., is not unfavourable for mining operations. The summer weather is dry, seldom excessively hot, and is hardly surpassed anywhere. The winter season, lasting from November to April, is cold, sometimes extremely so, the thermometer occasionally dropping to 60° or more below zero. These cold spells are, however, exceptional, never last long, and do not seriously interfere with outside work. The ordinary winter temperatures of from zero to 40° below are not unpleasant, and entail no hardships when properly prepared for.

#### Economic Geology—General Characteristics of Ore Deposits—Distribution.

The copper belt, as determined by present discoveries, extends along the valley of the Lewes River, from a point east of Dugdale, on the White Pass Railway, northward to the base of Mount Haeckel, a distance of about twelve miles. The width of the belt seldom exceeds a mile, and in places is confined to a single line. The distribution of the discoveries along the belt is exceedingly irregular. The croppings follow a series of limestone areas enclosed in granite, or lying between granite and porphyrite. Where the limestone is absent the belt is practically barren; and considerable stretches of it otherwise favourable, such as that extending from the Spring Creek to the Pueblo claim, a distance of three and a half miles, are hopelessly buried beneath heavy accumulations of drift.

#### Ore Bearing Formations.

The rock formations of the district consist, in order of age, of limestone, porphyrites, granites and granodiorites, an extensive system of porphyrite dikes, and finally, basalts. Of these only the limestones and granitic intrusives are important economically. The principal ore bodies now being developed occur in the limestone, close to or adjoining the granite. Numerous discoveries have also been made in the granite, often at considerable distances from the limestone. The limited work done on these has not so far disclosed ore bodies of commercial value. The constituent minerals and general character of the ore bodies in the two formations are similar.

Copper minerals seldom develop in the porphyrites, but are not altogether unknown. The porphyrites are often closely interbanded with the limestones; and when this occurs in an altered area, both rocks are sometimes affected. The mineralization of the porphyrites is usually limited to a narrow zone, a few inches in width, bordering the limestone.

#### Principal Minerals.

The principal economic minerals of the district are the two copper sulphides, bornite, and chalcopyrite.

Tetrahedrite occurs at the Arctic Chief, and small bunches of chalcocite at the Best Chance, and other places. Copper minerals resulting from the oxidation of the sulphides are conspicuous at all the workings, but, except at the Pueblo, are seldom important as ores. They include the two copper carbonates, malachite and azurite, the red and black oxides cuprite and malaconite, and the silicate chrysocolla. The cuprite is occasionally associated with small grains of native copper.

The iron sulphides are not abundant and nowhere form large masses. Scattered grains of pyrite occur in the granites, altered limestones, and more frequently in the porphyrites, but are rarely found in connection with the ore bodies. Small quantities of pyrrhotite occur at the Arctic Chief. It was not observed elsewhere.

The iron oxides, magnetite and hematite, on the other hand, are widely distributed, and both occur in large masses. Magnetite is especially abundant, and is seldom absent from the mineralized areas. Lenses of this mineral, ranging in size from a few inches to 360 feet in length, are found all along the belt, mostly in the altered limestones, but also occasionally in the altered granites. Hematite is less common. It occurs in large tabular crystals at a number of the showings, and is the principal mineral in the great Pueblo lode.

Other metallic minerals of less frequent occurrence are arsenical pyrites, stibnite, galena, sphalerite, and molybdenite. Gold and silver in some quantity occur in all the ores. The values range from traces up to several dollars per ton. Gold is occasionally found native.

The principal non-metallic minerals accompanying the ores are garnet (andradite), augite, tremolite, actinolite, epidote, calcite, clinocllore, serpentine, and quartz. Of these, garnet, augite, calcite, and tremolite, are the most abundant. Quartz is sparingly distributed and seldom occurs in quantity.

#### Ore Bodies.

The ore bodies fall into two classes—those in which the copper minerals are associated with magnetite and hematite, and those in which various silicates, principally garnet, augite and tremolite, are the chief gangue minerals.

The magnetite ore bodies are numerous, and occur enclosed completely in altered limestone, along the lime-granite contact, and in a few instances, in areas of altered granite. The largest bodies so far discovered are the Best Chance, 360 feet in length; the Arctic Chief, 230 feet, and the Little Chief, 100 feet. The magnetite masses are always sprinkled more or less plentifully throughout with grains and small masses of bornite and chalcopyrite. The two sulphides occur, both separately and intergrown, and are of the same age as the enclosing magnetite. The copper percentage varies greatly in different parts of the same lode, the general average approximating four per cent. The gold and silver are negligible in some of the ore bodies and important in others.

Besides the copper minerals, serpentine, calcite, clinocllore and other secondary minerals, are often associated with the magnetite, and rarely pyrrhotite and sphalerite.

Hematite masses are much less common than magnetite, only one large body being known. This is the Pueblo lode, on Porter Creek. The upper explored portion has developed altogether in limestone. Granite outcrops in the vicinity, but its contact with the limestone is concealed by drift. It differs from the mag-

netite ore bodies principally in the greater oxidation of the copper minerals. It is more porous and the original sulphides or sulphide have been largely converted by surface waters into carbonates, oxides, and silicates. Some chalcopyrite survives in portions of the lode. No bornite has been found.

Showings characterized by a garnet-augite-tremolite gangue are numerous wherever the lime-granite contact is exposed. They vary in size from a sprinkling of copper minerals to considerable lenses of shipping ore, such as those developed on the Grafters, Copper King, War Eagle and Valerie. All the important ore bodies of this class, so far discovered, occur in the limestone, close to the granite, and are often separated from the granite by a zone of more or less completely replaced limestone. The valuable minerals are similar to those in the iron masses, and consist mostly of bornite and chalcopyrite, carrying small quantities of gold and silver. At the Valerie, bornite is absent, and the chalcopyrite is associated with mispickel, the only known occurrence of this mineral in the camp.

The ore bodies of this class are occasionally tabular in shape, and have the appearance of following particular limestone beds; but in most cases the outlines are very irregular. The Copper King and Valerie lodes are short and blunt, while that on the Grafters, as shown in the present workings, is shaped like a horseshoe, and partially encircles a core of unreplaced limestone. The copper minerals at the Grafters and Copper King stop rather abruptly against a marble foot-wall; but as a rule they have no definite limit, and extend in diminishing quantities for some distance beyond the valuable portions of the lode. In some instances, as on the Anaconda, the ore alternates with bands of limestone, and limestone replaced by garnet and augite.

None of the ore bodies has so far been followed to a greater depth than 100 feet, and the question of downward extension has not been decided practically. At the limited depths reached, some of the lodes show increased and others decreased volumes, while the character of the ore remains unchanged. Contact replacement deposits, the class to which these belong, are apt to be buncchy, and somewhat uncertain; but theoretically may descend as long as the limestone lasts. They are dependent on the limestone, and the deposits formed in the larger areas will probably prove more permanent than those in the small inclusions. The latter are themselves liable to be cut off a short distance below the surface.

The copper percentage in the siliceous ores is higher as a rule than in the iron ores, those shipped up to the present time probably averaging over eight per cent. The precious metal contents are moderate, seldom exceeding \$3 per ton.

The following analyses of the Arctic Chief magnetite ore and of siliceous ores from the Grafters, War Eagle and Valerie, are furnished by Mr. Robert Smart, territorial assayer, Whitehorse, Yukon Territory:—

|                           | Arctic Chief. | War Eagle. | Grafters. | Valerie. |
|---------------------------|---------------|------------|-----------|----------|
| Gold, oz. per ton.....    | 0.21          | 0.05       | 0.05      | 0.075    |
| Silver, oz. per ton.....  | 1.20          | 3.30       | 1.55      | 1.05     |
| Copper, percentage...     | 3.21          | 8.80       | 7.90      | 12.90    |
| Iron, " " " " " " " "     | 45.50         | 4.40       | 7.12      | 6.39     |
| Alumina, " " " " " " " "  | 12.08         | ...        | 3.88      | 1.95     |

| Silica, " " " " " " " "   | 9.67          | 55.80      | 56.01     | 23.91    |
| Sulphur, " " " " " " " "  | 2.53          | 6.60       | 2.78      | 4.21     |

### Oxidation.

The ore bodies come to the surface practically unaltered, the gossan capping having disappeared during the glacial period. The copper minerals in the dense magnetite masses are slightly oxidized on exposed surfaces along the sides down to the lowest depth reached, and following occasional partings, but the percentage affected is small. The hematite masses, as represented by the Pueblo lode have suffered more. While the iron shows little change, the copper sulphides, down to a depth of 100 feet at least, are largely replaced by carbonates and other derivative minerals.

The oxidation of the siliceous ores varies with the gangue, but is nowhere extensive. It is greatest where the sulphides, as rarely happens, are enclosed in limestone, and decreases as the proportion of limestone lessens. Where the gangue is composed of a compact mass of secondary minerals, little alteration is noticeable, except on the immediate surface.

### Classification.

The Whitehorse copper ores possess all the characters distinguishing ordinary contact metamorphic deposits. They occur mostly in metamorphic limestone close to or in direct contact with the granite or granodiorite which altered it. Veins, with the exception of occasional thin seams evidently of secondary origin, are unknown. The ore bodies are irregular in outline, are occasionally banded, and vary in size from small lenticles a few inches across—often completely enclosed in limestone—to masses measuring hundreds of feet in length. The constituent minerals are those that everywhere characterize contact deposits. The common ore minerals are magnetite, hematite, bornite and chalcopyrite, and those less frequently found: tetrahedrite, chalcocite, molybdenite, mispickel, galena, stibnite, pyrrhotite, pyrite, zinc blende and rarely free gold. The gangue minerals include garnet, augite, tremolite, actinolite, epidote, scapolite, quartz, and calcite. The minerals, both metallic and non-metallic, were deposited metasomatically in the limestone and granite and, with trifling exceptions, are products of one period of mineralization.

There is one important point, however, in which the deposits in question differ somewhat from the published descriptions of other members of this class, viz., in the intense and widespread mineralization of the intrusive itself. While the large aggregates of metallic minerals occur in the limestone or along the contact, numerous small bodies and scattered grains are frequently found wholly enclosed in granite, often at a considerable distance from the limestone. Instances of this occur at the Pueblo No. 5, Whitehorse, Keewenaw, and other claims. At the Best Chance large grains of chalcopyrite occur in granite, which microscopically show little alteration.

The development of non-metallic minerals in the granite is probably greater than in the limestone, and the areas affected are wider and more extensive. At the Arctic Chief the granitic rocks are well mineralized for a distance of 400 feet back from the lime contact.

The minerals found in the granite are similar to those in the limestone, although the proportions are somewhat different. The most important are the brown lime-iron garnet andradite, augite, and green epidote. At a number of points both rocks are wholly replaced where they meet, and the original contact usually sharply defined is completely obscured. It is

represented by a compact mass of secondary minerals, which fade into granite on the one side, and limestone on the other. The transmission from wholly altered to unaltered rock is usually more abrupt in the limestone than in the granite.

The origin of contact deposits, such as these described, has recently been thoroughly discussed by Lindgren, Vogt, Weed, Kemp, and others, and the general conclusion reached, that they are directly due to the passage of gaseous or liquid emanations, laden with the requisite materials from a cooling, but still liquid intrusive magma into the bordering sedimentary, is now generally accepted. In most cases described the migration of material was lateral and the ore deposits formed in the sedimentary before the adjoining magma solidified. The extension and simultaneous mineralization of both the intruding and intruded rocks in the Whitehorse district can hardly be explained except by assuming that the movement was upward, and took place after the former hardened to some depth. The conditions indicate that both the porous limestone and the jointed granite furnished channels for the ascending solutions.

The behaviour of the aplitic dykes is also signifi-

### Geology.

The Arctic Chief ore body is strictly a contact deposit between limestone, and a granitoid rock of variable composition, but mostly a hornblende granite. It is situated on the west side of a long irregular limestone bay, penetrating the granite area in a northerly direction. The limestones enclosed in the bay are similar to those along other portions of the copper belt. They are homogeneous crystalline rocks, white to greyish in colour, and as a rule remarkably free from inclusions and impurities, except near the contact with the intrusive. They have been welded into solid masses in places, but over most of the area the bedding is even and regular.

The bordering intrusive, in the vicinity of the ore body, is an altered quartz diorite, loaded with secondary minerals, among which garnet, augite, epidote, calcite, chalcopyrite, and magnetite are conspicuous. The dioritic phase is local, and the diorites pass towards the west and north into hornblende granites, and the sections show a further transition, at one point, into hornblende syenite.

cant in this connection. They are not abundant, but the few examples seen in the mineralized areas all show more or less alteration. Granite dykes, apophyses from the main granite area, traverse both the Little Chief and Pueblo iron lodes. In both instances the dyke material is now largely replaced; in the former by magnetite, and in the latter by hematite. The later porphyrite dykes occasionally found cutting the ore bodies have not been affected.

#### Description of Some of the Principal Mines and Prospects—Claims in the Central Part of the District—The Arctic Chief.

The Arctic Chief is situated near the centre of the copper belt, at an elevation of 922 feet above Whitehorse, and 3,012 above the sea. A wagon road, 7.1 miles in length, connects it with the present railway terminus at Whitehorse. It was staked July 12, 1899, by Capt. John Irving, of Victoria, B.C. During the past season it was under bond to the Arctic Chief Copper Mines Company, with headquarters at Spokane, Wash., U.S.A.

The granites near the Arctic Chief ore body are exceptionally strongly mineralized. The affected area has a length of 1,000 feet, following the limestone contact, and a width of 400 feet. The mineralization is not uniform, and gradually diminishes away from the ore body. Where most intense, the original rocks are almost entirely replaced by alternating bands and masses of garnet, and a green augitic rock, classed as pyroxenite. The highly altered areas are often clearly traceable into unmistakable granites, holding scattered crystals, and masses of garnet and epidote, and farther away into the unaltered variety.

The principal secondary minerals present are, garnet, augite, epidote, magnetite associated with bornite and chalcopyrite, actinolite, and seapolite. Epidote, while not occurring in such quantities as garnet, is found over a wider area. Magnetite occurs in small and large lenses, and is widely distributed in individual grains. Pink seapolite is conspicuous in places, but is not quantitatively important.

A few small inclusions of crystalline limestone occur in the altered granitic area, and may have influenced

its mineralization. They contain the same secondary minerals as the granite, but in somewhat different proportions. Brown andradite is the chief mineral in both rocks, while epidote is relatively less abundant in the limestones than in the granite.

A number of large dykes occur in the vicinity of the Arctic Chief lode, cutting sharply across both limestone and altered granite. They were intruded after the formation of the ore bodies, and had no effect on the mineralization of the region.

#### Development.

The Arctic Chief ore body outcrops on rising ground, and has been opened up by means of a tunnel. Development work commenced in 1902, but has proceeded slowly. The present owners are making a systematic attempt to define the limits of the ore body. The principal workings consist of a tunnel, 230 feet in length, with short cross-cuts at intervals to the walls of the lode. The tunnel, with the exception of the first 65 feet, follows ore throughout. A shaft has been sunk near the centre of the ore body, to a depth of 50 feet below

OUTLINE OF ARCTIC CHIEF ORE BODY ON MAIN LEVEL

the main level; and an upraise to the surface, 65 feet in length has just been completed. The lower part of the shaft is in altered diorite, and some drifting was done from the foot of it during the past season; to determine the character of the ore body at that level. The drifting was not extensive enough to give positive results.

(To be continued.)

## THE PRODUCTION OF ASBESTOS IN CANADA

By John McLeish, B.A.

Asbestos is mined in Canada in the Eastern Townships, Province of Quebec, at Black Lake, Thetford, East Broughton and Danville. Other occurrences of the mineral have been noted, and some shipments were at one time made from the Township of Denholm, in the county of Wright, north of the city of Ottawa, but the first-mentioned districts are the only localities in which mining is at present being carried on. The mining of asbestos in this region dates from about 1878, and statistics of production since 1880 are shown in tables following. The value of the annual output has grown from less than \$25,000 in 1880 to over \$2,573,000 in 1908, so that next to coal this is now one of the most important of non-metallic mineral products, and supplies a very large proportion of the world's demand. A special report on this subject has been published by this

branch, though now unfortunately out of print. A revised edition is, however, in course of preparation.

#### Production.

A portion of the output is sufficiently high grade to be shipped as crude; the greater part, however, is crushed and the fibre extracted by special machinery. A uniform system of classification has not yet been adopted by the operating companies, but for statistical purposes the shipments have been classified on a valuation basis, the crude being divided into two classes and the mill fibre into three grades; the short fibred, asbestic, and sand, being separately classified.

The total shipments in 1908 aggregated 90,773 tons valued at \$2,573,335, as compared with shipments in 1907 of 90,426 tons valued at \$2,505,042, the shipments in 1908 being the largest both in tonnage and value yet recorded. Details are given in Table I.

ASBESTOS.—TABLE 1.

Production by Classes, Calendar Years 1907 and 1908.

|                        | 1907.       |           |          | 1908        |           |          |
|------------------------|-------------|-----------|----------|-------------|-----------|----------|

| Mill Stock, No. 1..... | 3,675       | 300,925   | 81 88    | 5,282½      | 425,448   | 80 54    |
| " " 2.....             | 43,821      | 1,247,078 | 28 46    | 45,545½     | 1,345,750 | 29 33    |
| " " 3.....             | 10,307      | 106,132   | 10 30    | 12,374½     | 114,931   | 9 29     |
| Total asbestos.....    | 62,130      | 2,484,767 | 39 99    | 66,548      | 2,555,361 | 38 40    |
| Total asbestic.....    | 28,296      | 20,275    | 0 72     | 24,225      | 17,974    | 0 74     |
| Grand total.....       | 90,426      | 2,505,042 | .....    | 90,773      | 2,573,335 | .....    |

While the average prices in each class are given in the above, the classification is based approximately on the following maximum and minimum prices per ton:—

Range of Prices of Asbestos During the Years 1907-8.

|                        | 1907.  |           | 1908.  |           |
|------------------------|--------|-----------|--------|-----------|
|                        | \$ c.  | \$ c.     | \$ c.  | \$ c.     |
| Crude, No. 1.....      | 225 00 | to 300 00 | 267 00 | to 350 00 |
| " 2.....               | 100 00 | " 200 00  | 75 00  | " 225 00  |
| Mill Stock, No. 1..... | 57 09  | " 163 00  | 60 00  | " 100 00  |
| " " 2.....             | 18 00  | " 50 00   | 20 00  | " 50 00   |
| " " 3.....             | 8 00   | " 15 00   | 5 00   | " 13 00   |
| Asbestic.....          | 0 50   | " 2 00    | 0 35   | " 1 16    |

Although the total tonnage shipped in 1908 was only 347 tons in excess of the 1907 shipments, it will be seen that the amount of crude shipped in 1908, despite a higher average price, was less than the 1907 crude shipments by 981 tons. The fibre shipments on the other hand were 5,399 greater in 1908, and brought a higher average return per ton of \$1.22. The asbestic shipments in 1908 were 4,071 less than in 1907.

In Table 2, following, the production of crude asbestos and mill stock since 1903 is separately shown. The statistics indicate that during the past six years there has been only a slight increase in the quantity shipped as crude, although the average price has nearly doubled; while on the other hand the shipments of mill stock have increased over 125 per cent. in the same time, with an increase of over 50 per cent. in the average price per ton obtained.

ASBESTOS.—TABLE 2.

Annual Production of Crude and Mill Stock 1903-1908.

| Calendar Year. | CRUDE       |         |          | MILL STOCK. |           |          |
|----------------|-------------|---------|----------|-------------|-----------|----------|

| 1907.....      | 4,327       | 830,632 | 191 97   | 57,803      | 1,654,135 | 28 62    |
| 1908.....      | 3,345½      | 669,232 | 200 04   | 63,202      | 1,886,129 | 29 84    |

Table 3 shows the total shipments of asbestos and asbestic separately for each year since 1880.

demand, the Canadian output of asbestos finds a wide distribution.

Exports and Imports.

Supplying as it does the greater part of the world's

During the twelve months ending March 31, 1908, exports were made as follows:—

| Countries.         | Tons. | Value.  | Countries.         | Tons.  | Value.    |
|--------------------|-------|---------|--------------------|--------|-----------|
|                    |       | \$      |                    |        | \$        |
| Great Britain..... | 5,347 | 237,152 | Italy.....         | 814    | 21,678    |
| Belgium.....       | 3,372 | 86,871  | Japan.....         | 97     | 3,177     |
| France.....        | 2,332 | 50,612  | United States..... | 46,846 | 1,322,890 |
| Germany.....       | 225   | 8,195   | Total.....         | 59,033 | 1,730,575 |

Exports to Great Britain, United States, Germany and other countries during the past six calendar years

are shown in Table 4, and total exports each year since 1892 in Table 5.

ASBESTOS.—TABLE 3.  
Annual Production since 1880.

| 1894           | 7,987  | 477,837 | 59 82          | 1903           | 31,780 | 891,033   | 28 04          |
| 1895           | 7,442  | 421,690 | 56 66          | 1904           | 37,272 | 1,160,887 | 31 14          |
| 1896           | 11,842 | 567,967 | 47 96          | 1905           | 47,031 | 1,386,115 | 29 47          |
| 1897           | 15,570 | 473,274 | 30 40          | 1906           | 59,854 | 1,689,257 | 28 22          |
| 1898           | 15,346 | 494,012 | 32 19          | 1907           | 56,753 | 1,669,299 | 29 41          |
| 1899           | 17,883 | 473,148 | 26 46          | 1908           | 61,210 | 1,842,763 | 30 11          |
| 1900           | 16,993 | 693,105 | 39 61          |                |        |           |                |

Although the chief source for the raw material, Canada does not as yet manufacture all the asbestos goods required for home consumption. There is, therefore, a considerable importation of asbestos goods under the

import classification "Asbestos in any form other than crude and all manufactures of," the duty being 25 per cent. The annual value of the imports is shown in Table 6.

ASBESTOS.—TABLE 6.  
Imports Fiscal Years 1885-1908.

\* Asbestos in any form other than crude, and all manufactures of. Duty 25 per cent.

Outside of Canada the chief asbestos producing country is Russia, whose output in 1907 is reported as 9,356 metric tons. The United States, Cape Colony and

Cyprus are also producers, though the quantity is not important.

Table 7 shows the principal productions since 1902.

The following is a list of the principal producing companies in Canada:—

#### List of Operators.

Dominion Asbestos Co., Ltd., Montreal, 415 Merchants Bank building.

Standard Asbestos Co., Ltd., Montreal, 415 Merchants Bank building.

Union Asbestos Mines, Calmon, Que.

Johnston's Asbestos Co., Ltd., Thetford Mines, Que.

Bell Asbestos Mines, Thetford Mines, Que.

Beaver Asbestos Co., Thetford Mines, Que.

King Asbestos Mines, Thetford Mines, Que.

The Asbestos and Asbestic Co., Ltd., Asbestos, Que.

Broughton Asbestos Fibre Co., East Broughton Sta., Que.

The Quebec Asbestos Co., Sherbrooke, Que.

Eastern Townships Asbestos Co., East Broughton Sta., Que.

British Canadian Asbestos Co., Ltd., Black Lake, Que.

#### Companies Prospecting or Expecting to Operate.

Megantic Mining Co., Montreal, 88 McGill St.

W. H. Lambly, Inverness, Que.

Brompton Lake Asbestos Co., Montreal, 17 Victoria Square.

The Asbestos Mining & Manufacturing Co., Sherbrooke, Que.

Boston Asbestos Co., Ltd., East Broughton Sta., Que.

Robertson Asbestos Mining Co., Drummondville, Que.

The Ling Asbestos Co., East Broughton Sta., Que.

The Thetford Asbestos & Exploration Co., Thetford, Que.

The Imperial Asbestos Co., Montreal, Que.

La Sompagnie d'Amiante Champlain, Quebec, 81 Rue St. Pierre.

**The Engineering and Mining Journal, November 20, 1909.**—Kenneth S. Gunterman contributes an article entitled "Mining Coal in Southern Colorado" to this number. He describes the mine and plant of the Carbon Coal and Coke Company. The coal mined is a good coking fuel, but high in ash—23 per cent. It, therefore, requires washing. The seams worked are from 3 feet to 7 feet thick. Much bone coal is encountered.

The double-entry, room-and-pillar method of mining is practised. Over 90 per cent. of the coal is recovered in mining. The coal is crushed, washed, and delivered to bee-hive ovens. Four Covington coke-drawing machines are in commission. Each pulls 48 ovens per shift. The coke yield is over 72 per cent. This heavy yield is largely attributable to the use of the coke-drawing machines.

# EIGHTEENTH ANNUAL REPORT OF THE ONTARIO BUREAU OF MINES, 1909

[Editor's Note.—The Eighteenth Annual Report of the Ontario Bureau of Mines has made its belated appearance. We are informed—and because of our own sufferings we readily accept the explanation—that the unspeakable printer is solely to blame. This being the case, it is surely possible for the Bureau to expedite matters by issuing the report in separate sections. Not only would this give the public the benefit of more timely service, but it would induce greater interest in each of the various special papers that make up the volume. For instance, the Statistical Review, an admirable piece of work, would lose nothing by being published as a separate. We hope that the Bureau will see its way clear to act upon this hint.]

The Eighteenth Report presents the usual summary review of the mining industry of the Province, along with a continuation of the series of reports on the iron ranges of northern and northwestern Ontario. Dr. A. P. Coleman, Dr. E. S. Moore, and Mr. R. C. Allen are the writers. Mr. M. B. Baker gives an account of his exploration of the region adjacent to Lake Abitibi, and, lastly, Dr. A. P. Coleman describes Lake Ojibway, the Last of the Great Glacial Lakes, and outlines his views on the Classification and Nomenclature of the Drift of Ontario.

Space permits notice only of the first section, the Statistical Review, by Deputy Minister Thos. W. Gibson.

## Statistical Review—Abstract of Mr. T. W. Gibson's Annual Resume.

The mineral output of Ontario in 1908 is valued by the Bureau at \$25,637,617, as compared with \$25,019,373 in 1907. The low price of silver affected not only the value but the output of that metal. The metallic products, principally silver, pig iron, nickel, and copper, furnished 65 per cent. of the total value, the non-metallic substances 35 per cent. Of the latter the most important were Portland cement, bricks, natural gas, petroleum, stone, salt, and lime, in the order named. For the first time the value of the natural gas produced was greater than that of petroleum, the former being nearly one million dollars, while the latter was but little over seven hundred thousand dollars. The production of the former is steadily increasing, and of the latter declining.

The itemized tabular statement of mineral production has already appeared in the Canadian Mining Journal. It may, therefore, be omitted here. A few remarks upon certain fluctuations will be all that is necessary.

Of the metallic products, silver was by far the most important, the output being 19,444,400 ounces, valued at \$9,136,830. This is an increase in value over 1907, of \$2,978,959. Next in value comes pig iron, \$490,839, followed by nickel, \$1,866,059, and copper, \$1,071,140. Gold stands at the modest figure of \$60,337.

Cement, valued at \$2,417,769; brick, \$1,575,875; natural gas, \$988,616, and petroleum, \$703,773, are the outstanding items in non-metallic production.

The metallic mineral production was responsible for the employment of 6,834 men, who were paid a total of \$4,770,044 in wages. The corresponding figures for the

non-metallic mineral industries are 8,355 men, and \$3,088,223 wages. The relatively small figure for total wages in this latter instance is mainly due, no doubt to the fact that many of the non-metallic mineral industries furnish employment only for part of the year.

**Basis of Statistical Values.**—Mr. Gibson again draws attention to the divergent methods employed by the mining department of the Dominion Government and the several Provinces. The Mines Branch, Ottawa, gives the Ontario production of nickel as 9,572 tons. The Bureau places it at 10,175 tons. In the former case the yield from the Cobalt region is not included; in the latter it is. Yet the Mines Branch values the 1908 nickel output at \$8,231,538; while the Bureau's valuation is only \$1,866,059. The explanation lies in the fact that the Mines Branch values the nickel contents of the mattes produced by the Sudbury smelters at the average price of refined nickel in New York; while the Bureau's figures represent the value of the nickel in the form of matte at the point of production, as given by the producers. Conflicting methods also obtain as regards pig iron.

Moreover, as the Mines Branch gives the figures for Canada only, and not for the individual Provinces, inspection of these figures, so far as the metalliferous products of Ontario are concerned, would lead to a mistaken idea of Ontario's position, especially as all of the nickel and nearly all of the silver produced in the Dominion come from this Province. It may be noted, also, that the Mines Branch values the non-metallic products at the mine or point of shipment.

Applying the methods used by the Mines Branch, the value of the metallic products of Ontario for 1908 would be \$22,330,062, instead of \$16,754,986. The total value of mineral production would therefore, amount to \$31,212,693, or \$6,193,320 more than the Bureau's returns indicate.

## Gold.

The number of companies producing gold last year was seven. These were Imperial Gold Mines (Laurentian mine,) Lepage Gold Mining Company (Grace mine, Michipicoten), Grace Mining Company (Eagle Lake), Cleveland Gold Mining Company, Empire Mining and Milling Company, Crystal Gold Mining and Milling Company, and the Golden Reed Mining Company. Most of these carried on operations intermittently and on a small scale, the principal producers being the Imperial, Lepage, and Cleveland companies. The total production of bullion was 3,465 ounces valued at \$60,337.

Interest in the gold districts of Sturgeon Lake and Lower Seine River was stimulated by promising finds in both places, the discoveries in the latter being at Glenorchy, about 40 miles east of Fort Frances, near many gold properties which were actively worked ten or twelve years ago, but have since been abandoned. All the eastern Ontario mines were idle, and of the Larder Lake companies none are yet steadily milling ore.

## Silver.

Though Cobalt is not the only, it is the chief, source of silver in Ontario at the present time, the mines of that

region producing an overwhelming proportion of the total yield. Other contributions were from the Port Arthur district, where one or two silver mines were operated during the year, and from the bullion produced at some of the gold mines. The total yield was 19,444,400 ounces, of which the mines of Cobalt produced 19,437,875 ounces, being an increase over the output in 1907 of 94 per cent. Ontario is now third in rank among the silver producing communities of the world, Mexico heading the list, and the United States coming second. The world's production in 1908 is placed at 183,800,000 ounces, so that Ontario's share of the output was about 11 per cent.

The course of prices for silver during the year was unsatisfactory. In New York the average in January per fine ounce was 55.678 cents; it rose in February to 56 cents, then fell steadily until August, when the average was 51.683 cents. September saw a slight rally to 51.720 cents, but a further decline set in, and the year closed with an average for December of 48.769 cents, the average for the twelve months being 52.864 cents per ounce. Notwithstanding the fall in price, the margin of profit is still large, some of the Cobalt mines that have published their cost sheets alleging their ability to produce silver at 7½ to 20.7 cents per ounce.

**The Producing Mines.**—There were thirty producing mines at Cobalt in 1908, the following list giving their names in the order of production: Nipissing, O'Brien, La Rose, Crown Reserve, Kerr Lake, Coniagas, Temiskaming and Hudson Bay, Temiskaming, Buffalo, Drummond, Trethewey, McKinley-Darragh-Savage, Cobalt Silver Queen, City of Cobalt, Standard Cobalt, Right of Way, Silver Leaf, King Edward, Cobalt Townsite, Nova Scotia. Other shippers were Foster Cobalt, Silver Cliff, Chambers-Ferland, Cobalt Lake, Peterson Lake, Nancy Helen, Provincial, Keeley, Colonial, Casey Cobalt. The most notable addition to the productive mines during the year was the Crown Reserve. This mine was opened up on that part of the bed of Kerr Lake sold by tender by the Government of the Province in January, 1907, the price paid being \$178,500 together with a royalty of 10 per cent. on the value of the output at the pit's mouth. A large vein, rich even for Cobalt, was struck during development work, and the Crown Reserve was a heavy shipper of high-grade ore during the year.

The quantity of ore and concentrates shipped out of the Cobalt camp in 1908 was 25,624 tons. Of this 24,487 tons was ore and 1,137 tons concentrates. The ore averaged 736 ounces per ton, and the concentrates 1,244 ounces. Only the poorer classes of ore, such as will not pay to ship, are subjected to concentration. This is evident from the fact that in order to obtain 1,185 tons of concentrates—the total production—50,997 tons of ore and rock were put through the concentrating plants, being in the proportion of 43 tons of ore to one ton of concentrates. The silver recovered was about 28 ounces per ton of material treated, but the loss in the tailings would raise the average contents of the rock a little above this point.

As in former years, the bulk of the ore, so far as tonnage is concerned, was exported to the United States, where there is a demand, particularly from the smelters of Denver, Colorado, for the silicious low-grade ores of Cobalt for mixture with the sulphide concentrates resulting from the mill treatment of the gold and silver ores of Cripple Creek and Creede. Some

shipments to the United States were of high grade, but the gross value of the ores treated in Canadian smelters was almost three times the value of those exported. The value per ton of the shipments to the United States was about \$120, while that of the ores refined at home was about \$825. The distribution of the output of the Cobalt mines for 1908 is given by the T. & N. O. Railway Commission as follows:—

|                     | Tons.     | Per cent. |
|---------------------|-----------|-----------|
| Canada .....        | 7,401.14  | 29.18     |
| Great Britain ..... | 222.08    | .88       |
| Germany .....       | 229.46    | 1.18      |
| United States ..... | 17,439.42 | 68.76     |

The total value of the output of silver from the beginning of mining operations in the Cobalt camp to the end of 1908 amounts to \$20,428,710. This was yielded by 46,912 tons of ore, aggregating 36,105,788 ounces and averaging 769 ounces; and 1,137 tons of concentrates, aggregating 1,415,395 ounces, and averaging 1,244 per ton. The average silver content per ton of ore for the five years of operation is:—

|           |              |
|-----------|--------------|
| 1904..... | 1,309 ounces |
| 1905..... | 1,143 “      |
| 1906..... | 1,013 “      |
| 1907..... | 677 “        |
| 1908..... | 736 “        |

**Total Silver Production of Ontario.**—An attempt has been made to ascertain the entire yield of silver in Ontario up to the present time. The statistics of production while the Silver Islet mine, and later the mines on the mainland in the Port Arthur region, were being worked, were not officially collected, and it is difficult now to reconstruct them with exactness, as the figures of the output of individual properties given or referred to in the reports of the Geological Survey of Canada and the Bureau of Mines are incomplete, and in some instances contradictory.

The greater part of the silver so far obtained in the Lake Superior region has come from the Silver Islet mine. This deposit was discovered in 1868, and operations were begun in September, 1870, finally ceasing in 1884. The output is valued by different authorities at sums varying from \$3,000,000 up to \$4,500,000. Mr. E. D. Ingall tabulates the production year by year, showing it to have had a total value of \$3,047,532.04, but adopts the statement of Mr. Richard Trethewey, superintendent of the mine when it closed, that the total value of silver produced from the commencement to the close of operations was \$3,250,000. Mr. A. Blue, late Director of the Bureau of Mines, says the mine “yielded in all from first to last \$3,500,000.”

From several gentlemen, interested in mining, whose experience and recollection cover the productive periods of the Lake Superior silver region, and who had good opportunities of learning the facts, figures of production from the mines on the mainland have been obtained, differing as to individual properties, but agreeing closely in the total. Statement No. 1 is furnished by Mr. W. A. Preston, M.P.P.; statement No. 2 by Mr. F. S. Wiley:—

#### Statement No. 1.

|                                          |           |
|------------------------------------------|-----------|
| Beaver mine .....                        | \$550,000 |
| Silver Mountain, East and West End ..... | 500,000   |
| Badger and Porcupine .....               | 300,000   |
| Rabbit Mountain .....                    | 50,000    |
| Thunder Bay mine .....                   | 20,000    |
| Shuniah mine .....                       | 50,000    |

|                            |             |
|----------------------------|-------------|
| 3 A and Beck mine.....     | 10,000      |
| Jarvis Mining Company..... | 40,000      |
| Total .....                | \$1,520,000 |

**Statement No. 2.**

|                                |             |
|--------------------------------|-------------|
| Beaver mine .....              | \$700,000   |
| Silver Mountain, East End..... | 30,000      |
| Silver Mountain, West End..... | 300,000     |
| Badger and Porcupine .....     | 500,000     |
| Other properties .....         | 50,000      |
| Total .....                    | \$1,580,000 |

The price of silver from 1882 to 1890, when the bulk of the production from these mines was made, fell from \$1.136 per ounce in the former year to \$0.935 in 1889 and to \$1.046 in 1890. The average during the period would be about \$1.035 per ounce. Applying this price to the smaller of the above estimates, we have 1,468,599 ounces as the quantity obtained up to the closing of the mines in 1893. One or two of the Lake Superior mines, notably Silver Mountain West End, have been worked in a more or less desultory way since that time, beginning in 1898, the output from 1898 to 1903, according to returns made to the Bureau of Mines, being 617,433 ounces valued at \$365,681.

We can now sum up as follows:—

|                                                            | Oz. silver. | Value.       |
|------------------------------------------------------------|-------------|--------------|
| Silver Islet mine.....                                     | 2,662,509   | \$3,250,000  |
| Mainland group, to 1893.....                               | 1,468,599   | 1,520,000    |
| Mainland group, 1894 to 1903<br>inc.....                   | 617,433     | 365,681      |
| Production previous to opening<br>of Cobalt mines.....     | 4,748,541   | \$5,135,681  |
| Production subsequent to open-<br>ing of Cobalt mines..... | 37,586,970  | 20,468,751   |
| Total production to 31st<br>December, 1908 .....           | 42,335,511  | \$25,604,432 |

**Refining Plants and Concentrators.**—There were three reduction plants in Ontario treating ore from the mines of Cobalt last year, namely, those of the Canadian Copper Company at Copper Cliff, the Deloro Mining and Reduction Company at Deloro, and the Coniagas Reduction Company at Thorold. Through these works there were passed an aggregate of 6,958 tons of ore containing 11,658,008 ounces of silver, of which 8,972,958 fine ounces were recovered, the remainder, 2,685,050 ounces, being contained in the speiss product reserved or exported for further treatment. This does not include the operations of the Nipissing Reduction Company or the Muggley Concentrators, Limited, at Cobalt, which carried on a concentrating business only, shipping the product to smelters for refining. The number of workmen employed at these various plants was 247, and the wages paid \$172,675.

The following companies have installed concentrating mills which were in operation during the year: Buffalo Mines Company, Coniagas Mines, Standard Cobalt Mines, King Edward Cobalt mines; and in addition to these there were custom plants owned and operated by the Northern Customs Concentrators (formerly Muggley Concentrators), and the Nipissing Reduction Company. There were also under construction concentrating mills at the Colonial, McKinley-Darragh-Savage, Nova Scotia and O'Brien mines.

**Ore Purchasers.**—Ore purchasers were somewhat

more numerous in 1908 than in 1907. The American Smelting and Refining Company, New York, bought numerous consignments both for its Perth Amboy, N.J., and Denver, Col., works; the Pennsylvania Smelting Company of Pittsburg, Penn., whose plant is at Carnegie, Penn., also bought considerable ore, while the Balbach Smelting and Refining Company of Newark, N.J., and the United States Metal and Refining Company of Chrome, N.J., were occasionally in the market for high grade material. The Canadian Copper Company, Copper Cliff, Ontario, bought a large part of the high grade output of the camp. The Deloro Mining and Reduction Company, of Deloro, Ontario, while running mainly on the more valuable ores of the O'Brien mine, also bought and treated high class ores from other properties. The Coniagas Reduction Company at Thorold, Ontario, confined itself to the ores and concentrates of the Coniagas mine. The consolidated Mining and Smelting Company of Trail, B.C., took a few carloads. Beer, Sondheimer Company of Hamburg, Germany, purchased several lots of rich ore, and the Anglo-French Nickel Company of Swansea, Wales, a few consignments of silver-free cobalt ore.

**Arsenic, Nickel, Cobalt.**—The elements other than silver in the ores of the Cobalt camp are at present of comparatively little value, at any rate to the miners of the ore. Arsenic is no longer paid for by ore-buyers, and nickel is regarded as an impurity warranting the imposition of a penalty if in excess of the cobalt contents.

Cobalt itself is also much less valuable since the mines of this district were opened. The world's demand for cobalt oxide is in the neighbourhood of 275 or 300 (short) tons per annum, while the product of the Cobalt mines, if all converted into oxide, would amount to upwards of 1,500 tons per annum. In 1907 the ruling rate was \$2.50 per pound, but successive reductions have brought the price down to about a dollar per pound, with prospect of a still lower level. In such circumstances it was but natural that the value of cobalt in the ore should also fall, and as a matter of fact for the greater part of the cobalt contained in the ore shipments of 1908, the mine-owners received nothing at all. Even for silver-free cobalt ore the price has been reduced, and now ranges from 25 to 45 cents per pound, according to the proportion of the cobalt contents upwards from eight per cent.

**Labour Employed.**—The number of men employed in the silver mines of Cobalt, including all those engaged in the works for the reduction of the ores at Copper Cliff, Deloro and Thorold was 2,414, and the amount paid out in wages \$2,159,055. Of these 1,039 were underground workers and 1,325 above ground.

There were no labour strikes or troubles in Cobalt during 1908.

**Dividend-Paying Mines.**—Cobalt has given rise to a vast number of mushroom mining companies, so-called, whose operations were for the most part carried on in the advertising columns of the city newspapers rather than among the rocks of the mining field itself; yet the amount paid out as dividends or profits to the shareholders of the producing companies has not only been very large in itself, but as compared with the value of the output has represented an unusual degree of profit. Fifteen companies have paid out as dividends \$8,313,461.54, and the list does not include the O'Brien and Drummond mines, the former of which is a partnership concern, and the latter a close corporation. Reckoning these two among the dividend-payers,

it will be found that the total returns or profits divided have been very little if at all short of \$10,000,000. The aggregate value of the production of the Cobalt camp has been \$20,962,942. Of this, as the table shows, almost fifty per cent. has been paid out as dividends.

**New Silver Fields.**—The search for other Cobalts has led to the discovery of silver in South Lorrain and in several districts in the valley of Montreal River and its branches. The broad geological features of the Cobalt area are repeated in these various regions, though there are somewhat marked differences in the relationships of the silver-bearing veins to the rock formation in the new fields as compared with the original one. In South Lorrain several promising properties are under development and in the Elk Lake, Miller Lake and Gowganda districts the discoveries been such as to warrant the hope that the deposits will prove remunerative.

In no case, however, has development proceeded sufficiently far to enable a positive statement to be made. In Gowganda the finds of native silver on the surface of the veins have been of remarkable quality, but on the whole the silver occurrences seem to be more irregular and of smaller proportions than those which have given Cobalt its pre-eminence among the silver camps of the world.

It is to be remembered, however, that the Cobalt deposits, though a natural, hardly constitute a fair standard of comparison. The fact is, that had Cobalt remained undiscovered, the new finds at Elk Lake, Miller Lake and Gowganda would have been regarded as phenomenal. The minerals found are those of Cobalt—silver, smaltite and niccolite.

**Nickel.**—The mattes produced from the nickel-copper ores of the Sudbury region in 1908 contained 9,563 tons of nickel, while in the ores raised in the cobalt-silver mines, it is estimated there were 612 tons of nickel. The total quantity of nickel raised in the Province last year was therefore 10,175 tons, though a money value is given only to the Sudbury product, that from Cobalt being a negligible quantity in this respect, and for a large part probably never entering into consumption in the arts. The aggregate yield of nickel was 797 tons less, and the output of the Sudbury deposits 1,039 tons, less than in 1907. The smaller production was due to the slackening of operations in the Sudbury field, the general depression in business leading to a falling-off in the demand. The value placed upon the nickel contents of the Sudbury mattes by the producers was \$1,866,059.

The Canadian Copper Company carries on mining and smelting on an extensive scale, and makes the larger part of the matte product. Last year it extracted from the Creighton mine 222,497 tons of ore, and from the Crean Hill 118,066 tons. The deposits at Copper Cliff, Stobie and other mines were not drawn upon. This company has a modern and very efficient plant, its smelters being situated at Copper Cliff.

The Mond Nickel Company's mines are situated in Denison and Garson townships, and its works at Victoria Mines, in the former. Like the Canadian Copper Company, it produces Bessemer matte of say 80 per cent. metallic contents, which is exported to Clydach, Wales, for refining by the Mond nickel carbonyl process. In 1908 the Mond Company raised 39,189 tons of ore from Victoria No. 1 mine, and 29,799 tons from the Garson mine.

The Dominion Nickel Copper Company, formed to exploit some large nickel ore deposits in the northern range, has not yet begun operations in the field.

**A New Nickel Area.**—An interesting and possibly important discovery was made during the year 1908, being of a deposit of pyrrhotite carrying nickel in apparently workable, even high proportions, outside of the recognized nickel-bearing areas of the Province. Hitherto, all known nickel bodies of economic consequence have been confined to the Sudbury field, and while occurrences of nickeliferous pyrrhotite have been noted in other parts of Ontario, they have invariably proven to be too low in nickel to be classed as ore. In the township of Dundonald, near the boundary of Clergue, on lot 1, concession three, a prospector named Alexander Kelso staked out several claims on a body of pyrrhotite carrying as high as 11.46 per cent.

There has been again a reduction in the valuation placed upon nickel contents of the Bessemer matte produced by the mining companies. In 1906 the value was estimated at an average of 17.8 cents per pound, in 1907, 10.7 cents per pound, and last year it fell to 9.75 cents per pound. The quotations for refined nickel in 1908 in New York averaged about 43 cents per pound, as against 45 cents per pound in 1907.

In the smelting of the ore into matte the consumption of coke at the nickel works was 64,868 tons valued at \$485,219, and the quantity of wood required for roasting the ore was 29,467 cords worth \$89,121. For the most part the machinery in the mines and smelting plants is now operated by electrical energy, generated by the Canadian Copper Company at High Falls, Spanish River, and by the Mond Nickel Company at Wabageshik Falls on the Vermilion. There is undoubtedly some loss of the metals in roasting and smelting the ores, but without making allowance for such losses, the ore put through the furnaces last year contained 2.65 per cent. of nickel and 2.08 per cent. of copper as compared with 2.95 per cent. nickel and 1.95 per cent. copper in 1907.

**Copper.**—The nickel-copper ores of Sudbury constitute the main source of the copper obtained in Ontario, and these deposits being worked primarily for their nickel contents, the production of copper from year to year depends more upon the demand for nickel than for copper itself. Consequently, the low level of copper prices during the past year—the average in the New York markets being 13,208 cents per pound, as compared with 20,004 cents per pound in 1907,—had little effect upon the output of the metal in this Province. In fact, the production of 1908 was greater than that of 1907. This was in part due to the higher average copper contents of the ores smelted in the Sudbury furnaces as compared with the previous year; but the increase in the copper output would have been still greater had prices ruled high, for the non-nickeliferous copper deposits of the north shore of Lake Huron and elsewhere were for the most part allowed to remain unworked during 1908. Practically, only one of these mines, the Hermina, raised any ore at all last year. The total production of copper was 7,561 tons, worth \$1,071,140, of which all but 60 tons was taken from the nickel-copper ores of the Sudbury field.

**Iron Ores.**—There were four iron mines from which ore was raised and shipped last year, namely, the Helen mine, Moose Mountain, Mineral Range and Wilbur. The first two are in northern, the last two in eastern Ontario. The total output was 216,177 tons valued at \$574,839, as compared with 205,295 tons worth \$482,

532 in 1907, an increase of 10,882 tons in weight and \$92,307 in value. Of the shipments, 166,231 tons was hematite and 49,946 tons magnetite.

**Pig Iron and Steel.**—Of the seven blast furnaces in the Province, five were in full campaign during 1908, namely, two belonging to the Algoma Steel Company, Sault Ste. Marie, two to the Hamilton Steel and Iron Company at Hamilton, and one to the Canada Iron Furnace Company at Midland; one, that of the Deseronto Iron Company at Deseronto, was in operation for a brief space only, while one, the property of the Atikokan Iron Company at Port Arthur, was idle throughout the year. The total production of pig iron was 271,656 tons valued at \$4,390,839, a falling off of 14,560 tons in weight and \$326,018 in value as compared with 1907. Steel rails to the extent of 126,775 tons, worth \$3,353,078, were made by the Algoma Steel and Iron Company and the Ontario Iron and Steel Company, Welland, amounting to 45,333 tons and valued at \$1,044,004.

The Electro-Metals Company, Welland, is operating a plant for the manufacture of ferro-silicon and other ferro compounds.

Mr. J. W. Evans M.E., of Belleville, who has for some time been experimenting in the production of steel from iron ore by the electric process, writes that in September, 1905, he obtained the first steel made directly from Canadian ores in the electric furnace. This was in the form of steel buttons made in a crucible. Since that time he had produced mild steel of good quality from Coc Hill ore, containing 68.01 per cent. of iron and 1.01 per cent. of sulphur, and from Bowen mine ore carrying 45.17 per cent. of iron and 7.44 per cent. of titanium. At the date of his letter, 7th June, 1909, Mr. Evans was using ore from the Orton mine, which assayed 52 per cent. of iron, 8 per cent. of titanium and a small amount of nickel, and in one and a half hours from the time the ore was placed in the furnace he obtained steel bars weighing over two pounds. The steel from Coc Hill ore contained from a trace to .04 per cent. of silicon, .08 to .17 per cent. of sulphur and .05 to .07 per cent. of carbon; from Bowen mine ore, silicon .05 to 2.31 per cent., titanium none to 1.02 per cent. and carbon .51 to .87 per cent. Mr. Evans remarks that in order to retain the titanium in the steel he had to reduce the proportion of lime in charge, which raised the amount of silicon. In his furnaces he employed a combination of the reflected arc and immersed electrodes as being more economical of electrical energy.

Following are details of the operations at the blast furnaces and steel works during 1908:

|                             |      |           |
|-----------------------------|------|-----------|
| Ontario ore smelted .....   | tons | 170,215   |
| Foreign ore smelted .....   | tons | 342,747   |
| Scale and mill cinder ..... | tons | 12,523    |
| Limestone for flux .....    | tons | 179,741   |
| Coke for fuel .....         | tons | 322,817   |
| Value of do .....           | \$   | 1,479,083 |
| Pig iron product .....      | tons | 271,656   |
| Value of do .....           | \$   | 4,390,839 |
| Steel product .....         | tons | 172,108   |
| Value of do .....           | \$   | 4,397,082 |
| Workmen employed .....      | No.  | 1,807     |
| Wages paid .....            | \$   | 1,001,893 |

The proportion of domestic ore charged into the blast furnaces rose from 23.6 per cent. in 1907 to 33.1 per cent. in 1908. Much the larger part of the ore raised from the mines of Ontario last year was shipped to furnaces in the Province although it was not all smelted within the year.

The record of the pig iron and steel manufacturing industry of Ontario during the last year is shown in the following table:

|                           |       |           |
|---------------------------|-------|-----------|
| Ontario ore smelted ..... | tons  | 170,215   |
| Foreign ore smelted ..... | tons  | 342,747   |
| Steel .....               | tons  | 172,108   |
| Coke .....                | tons  | 322,817   |
| Charcoal .....            | bush. | .....     |
| Pig iron .....            | tons  | 271,656   |
| Value of pig iron .....   | \$    | 4,390,839 |
| Steel .....               | tons  | 172,108   |
| Value of steel .....      | \$    | 4,397,082 |

**Arsenic.**—The arsenical deposits of Ontario are numerous and extensive. For the most part they consist of arsenopyrite, which as in the case of the ores of the county of Hastings, often carries values in gold. As a matter of fact, the only arsenic at present being made in Ontario is refined from the ores of the Cobalt camp, and is therefore, like a large proportion of the arsenic made throughout the world, in reality a bye-product.

There were obtained at the reduction works at Copper Cliff, Deloro and Thorold from silver-cobalt ores last year, a total of 702 tons of refined white arsenic, having a value of \$40,373, or say 2.87 cents per pound. In addition, it is estimated that there were 2,970 tons of arsenic contained in the ores which were exported for treatment. Doubtless a large proportion of this arsenic, if not the whole, is recovered in the various plants where the ores are refined, and eventually finds its way to market. The mine owners of Cobalt, however, get nothing for arsenic contents of their ores, and no figures of value are set opposite these exports of crude arsenic in the tables of production given in this report. In 1907 the quantity of white arsenic recovered was 348 1-2 tons, and the value as returned to the Bureau was \$40,104.

**Iron Pyrites.**—The iron pyrites industry of Ontario is developing. In 1905 the product of the mines was 7,325 tons, in 1907 15,755 tons, and in 1908 20,970 tons valued at \$69,980. The larger part of the output is shipped to the United States, but a considerable portion is utilized in the manufacture of sulphuric acid at Sulphide, Hastings County, where the Nickols Chemical Company have an extensive plant.

The producing companies in 1908 were the Northern Pyrites Company, the Nichols Chemical Company, the Northland Mining Company, and the Lake Superior Corporation. The first-named concern made a few trial shipments from their large pyrite bodies at Lake Minnitakie, having been afforded an outlet for their product by the completion of the branch line of the Grand Trunk Pacific Railway from Fort William. This company has made large preparations for business and expects to ship extensively to the American market in 1909. The Nichols Chemical Company's mine is at Sulphide in proximity to their acid works; the Lake Superior Corporation exported a small quantity of the granular pyrite found in the Helen iron mine at Michipicoten, and the Northland Mining Company has for some time been working a deposit near Rib Lake in the Temagami Forest Reserve.

The Lake Superior Corporation has large deposits of pyrite in the neighbourhood of Goudreau Lake, southwest of Missanabie on the Canadian Pacific Railway, which have not yet been worked, except for testing purposes.

**Mica.**—From the mica mines of the Province there were raised and shipped last year 368 tons of rough-cobbed amber mica the value of which was returned to

the Bureau as \$73,586. This is a decrease from 1907, when the output was 456 tons, worth \$82,929.

The principal producers were the Loughborough Mining Company, whose output is utilized by the General Electrical Company, and the Dominion Improvement and Development Company. The mines of the former are in the counties of Frontenac and Perth, and of the latter in the county of Perth.

**Salt.**—There is no rock salt mined in Ontario, the product being entirely the result of the evaporation of brine pumped up from the wells. These are situated on the shores of Lakes Huron and St. Clair, where immense deposits occur in the limestones of the Onondaga formation.

In 1908 the output of the wells was reported to the Bureau as 79,112 tons, valued at \$488,330, an increase over the product of 1907, when it was 62,806 tons, worth \$432,936. The chief operators were the Canadian Salt Company, with works at Windsor and Sandwich, and the Empire Salt Company of Sarnia.

**Petroleum.**—The petroleum wells of southwestern Ontario yielded in 1908, 18,479,547 Imperial gallons of crude oil, valued at \$703,773.

The falling-off as compared with the previous year was serious, being not less than 33 per cent. on the output of 1907. Part of the decrease may be explained by the gradual diminution in the yield of the wells of Lambton County field. The Petrolea and Oil Springs and Bothwell districts have been producing oil for upwards of forty years and the average production per well is now extremely small, being not over eight or nine gallons per day. It is only the large number of wells, and the economy in management which long experience has taught the operators, that enables Lambton County to be reckoned among the oil-producing regions to-day.

Scrutiny of the figures, showing the production of oil from the various districts, reveals the fact that the decline in yield of the more recent of the oil fields, namely, those in the County of Kent, has been proportionately greater than in the older sections. Whether this comparative rapidity of diminution will continue to characterize the production from Tilbury East and Romney, or whether the fluctuation is of a temporary character and will be compensated by the opening up of fresh pools from time to time, must remain for the future to show.

A statement of the production by districts, kindly furnished by Mr. W. J. Harvey, supervisor of the bounty paid by the Dominion Government on crude petroleum produced in Canada, and covering the last three years, shows the rapid increase and decrease of yield in the new fields, and also the decrease in the older ones:

| Field                        | Production<br>1906 | Production<br>1907 | Production<br>1908 |
|------------------------------|--------------------|--------------------|--------------------|
|                              | Bbl.               | Bbl.               | Bbl.               |
| Lambton . . . . .            | 377,286            | 304,212            | 265,368            |
| Tilbury and Romney . . . . . | 106,992            | 411,588            | 201,283            |
| Bothwell . . . . .           | 44,827             | 42,727             | 39,228             |
| Leamington . . . . .         | 39,652             | 6,133              | 9,334              |
| Dutton . . . . .             | 19,376             | 14,977             | 13,743             |
| Thamesville . . . . .        | 175                | 237                | .....              |
| Comber . . . . .             | 651                | ....               | .....              |
| Total . . . . .              | 588,962            | 779,876            | 528,959            |

The first strike of oil in the Tilbury field was made in December, 1905, the second producing well was drilled in March, 1906, and the third in the following month.

In Romney oil was struck about the close of 1906, and by the beginning of March, 1907, there were seven producing wells, several of which came in with a yield of over 1,000 barrels each per day. In July, 1907, the Tilbury and Romney wells were in full flow, making about 35,000 barrels of oil, while in November, 1908, seventeen months later, the production had fallen to about 12,000 barrels. As will be seen by the figures given above, the yield in the new field rose from 106,992 barrels in 1906 to 411,588 barrels in 1907, falling to less than half the latter quantity in 1908. Of the total decrease from 1907 to 1908, 250,917 barrels, Tilbury and Romney were responsible for 210,305 barrels and Lambton for 38,844. In other words, while the falling-off in Lambton in 1907 compared with 1906 was 19 per cent., and in 1908 compared with 1907, 12 per cent., the drop in Tilbury and Romney from 1907 to 1908 was 51 per cent.

**Petroleum Prices and Products.**—The price of crude petroleum in the oil fields of Ontario is regulated by the price paid by the Imperial Oil Company at its various receiving stations. It may cost the producer five to twenty cents a barrel to deliver it, so that the price is not a net one to him. There were practically no fluctuations during the year. The price delivered to the Imperial Company for nearly the first three months was \$1.34 per barrel, and for the remainder of the year \$1.44 per barrel; the average price therefore for the Petrolea district was \$1.41½ per barrel. At producers' tanks in the Tilbury field the price was \$1.17 per barrel from 1st January to 15th March, and from 15th March to 31st December \$1.27 per barrel. These prices of course do not include the Dominion Government bounty of 51½ cents per barrel. A barrel contains 35 Imperial gallons.

There are two petroleum refineries in the Province, owned and operated respectively by the Imperial Oil Company, Sarnia, and the Canadian Oil Refining Company, Petrolea. Together, these companies distilled 44,675,120 gallons of crude in 1908, so that the domestic product was equal to only 53 per cent. of the total quantity distilled. The remainder was of course imported from the United States.

### Natural Gas.

While the production of petroleum declined, the yield of the allied combustible, natural gas, underwent a decided expansion, and for the first time in the statistical history of the mineral industry of the Province, the value of the natural gas product was greater than that of petroleum, the figures for 1908 being petroleum \$703,773, natural gas \$988,616. The increase in 1908 over 1907 was \$242,117, or 32.4 per cent.

There are three fields in which natural gas is produced in quantity, (1) Welland County, (2) Haldimand County, to which must now be added Norfolk, (3) Essex and Kent. The Welland field produced gas to the value of \$343,560 or 34.8 per cent. of the whole, the Haldimand field \$535,182 or 54 per cent., and Essex and Kent \$109,874 or 11.2 per cent. In 1907 the proportions respectively were 46.44 and 10 per cent. Haldimand has now taken the lead, and the prospects are for a still further increase in the production of this district.

### Minor Products.

Among the lesser items on the list of mineral products of Ontario, apatite or phosphate of lime figures in 1908 for the first time in many years, some 881 tons having been raised of a value of \$7,048. The greater part of the output was shipped to Buckingham, Quebec, for

the manufacture of phosphorus for the English market, but part was manufactured into fertilizer at Smith's Falls, Ontario. Prices are higher in England than in Canada, and next season producers intend to export to that country. The competition of the cheaper and lower grade phosphates of the southern States has for a long time shut out the richer but more expensive product of Ontario and Quebec.

Corundum, owing to the stoppage of production on the part of the Canada Corundum Company, which has hitherto been the largest producer, shows a considerable falling-off as compared with recent years. This company's business in 1908 consisted mainly in marketing the stock of grain corundum on hand, little fresh rock being raised from the mines.

A plant for the grinding of talc has been erected in Madoc, Hastings County, by Messrs. Geo. H. Gillespie & Co., and began operations in September, 1908. It has a capacity of 400 tons per annum, the product being ground talc of three grades, namely, No. A1 (200 mesh), No. 1 (180-mesh), and No. 2, 3 per cent. retention on 180-mesh. Grade A1 is used by the makers of talcum powder and similar articles, No. 1 by soap makers, tanners and leather manufacturers, and No. 2 by the paper trade and in foundry facings. The product sells at the works at \$20 and \$25 per ton for No. A1, and \$15 to \$18 per ton for No. 1, including price of barrels, or \$7 per ton for No. 2, including sacks. The bulk of the product grades No. 2.

#### Revenue for the Year.

The total receipts on account of mining revenue for 1908 were \$549,178.94, apparently a heavy decrease as compared with those for 1907, when the amount was \$1,731,720.72. It must be borne in mind, however, that the income for 1907 was swelled by two items of an unusual character, paid in on account of the purchase of the beds of Cobalt and Kerr Lakes, and amounting together to \$1,155,000. Excluding this sum, the revenue for 1908 was only \$27,541.78 less than that for 1907. The items are as follows:—

|                                              |          |    |
|----------------------------------------------|----------|----|
| 1. Sales of mining land.....                 | \$23,445 | 30 |
| 2. Leases of mining land.....                | 20,611   | 81 |
| 3. Licenses, permits and recording fees..... | 137,730  | 20 |
| 4. Mining royalties.....                     | 218,071  | 96 |
| 5. Supplementary Revenue Act.....            | 125,078  | 06 |
| 6. Provincial Mine.....                      | 12,592   | 90 |
| 7. Diamond drills.....                       | 11,286   | 11 |
| 8. Assay Office, Belleville.....             | 362      | 60 |

Total.....\$549,178 94

#### Mining Royalties.

The details of item 4, mining royalties \$218,071.96, are as follows:—

|                                    |           |    |
|------------------------------------|-----------|----|
| O'Brien Mine.....                  | \$109,915 | 31 |
| Crown Reserve Mine.....            | 29,257    | 85 |
| Temiskaming & Hudson Bay Mine..... | 78,898    | 80 |

Total.....\$218,071 96

The O'Brien mine pays to the Crown twenty-five per cent. of the value of the shipments of ore, the consignments being valued at the pit's mouth. The agreement between the owners of the mine and the Crown exempts the latter from any part of the cost of underground work, or hoisting the ore, etc., but in calculating the royalty the surface expenses, such as sorting the ore, haulage and freight, etc., are to be deducted. The difficulty of proportioning exactly these expenses between the parties has led to a modification of the agreement,

by which practically the same rate or royalty is payable, while the deductions are more easily and certainly arrived at. A method of computing the royalty on concentrates is also provided. Up to the end of 1908 the O'Brien mine had contributed in all royalties amounting to \$332,860.37.

The arrangement with the Temiskaming & Hudson Bay Mining Company is somewhat different. It provides for the payment to the Crown of a net royalty of fifteen per cent. on the receipts from sales of ore. The amount paid in by this company last year included royalty on past shipments as well as those made in 1908.

In the case of the Crown Reserve mine, the royalty, which is at the rate of ten per cent. on the value of the ore at the pit's mouth, is really part of the purchase price of the property. The history of the sale of this parcel of land by the Crown is interesting. Part of the bed of Kerr Lake, in the Township of Coleman, which had not been staked out or claimed, as no vein was known to exist upon it, was offered for sale by tender in December, 1906. The highest bid was \$52,000, which was not considered sufficient. Tenders were again asked for, and the condition was added that a royalty of ten per cent. should be paid on the value of the ore. The highest offer received in response to the second advertisement was \$178,500, which was accepted. A rich vein was struck in developing the mine, and the Crown will probably receive at least as much by way of royalty as the original price.

There are several other properties charged with payment of royalty direct to the Department of Lands, Forests and Mines, exclusive of those which contribute royalties to the Temiskaming and Northern Ontario Railway Commission. They include the Hargrave locations, 25 per cent., Chambers-Ferland properties, 25 per cent., and Scully claims, 10 per cent. None of these paid anything in 1908, but the Chambers-Ferland Company will be a contributor in 1909.

The total receipts from mining royalties up to the end of 1908 were as follows:—

|                                    |           |    |
|------------------------------------|-----------|----|
| O'Brien Mine.....                  | \$332,860 | 37 |
| Crown Reserve Mine.....            | 29,257    | 85 |

# PNEUMATIC VERSUS ELECTRIC DRILLS IN MINING SERVICE

By Frank C. Perkins.

Fig. 1.

The wonderful development of electric power transmission and electrically driven labour-saving devices has caused compressed air apparatus of various types, such as pneumatic hoists and compressed air locomotives, to be replaced by electric motor-driven machines very largely. The pneumatic rock drill and pneumatic hammer and rivetter used in mining and structural work, however, have successfully met electric competi-

tion. The reason pneumatic rock drills, pneumatic hammers and rivetters have held their own, and are now more extensively employed than ever before, is without doubt on account of their many advantages, the compact construction and the development of more economical and efficient means of producing compressed air power.

In mining service and in the construction of tunnels and foundations for large buildings the pneumatic rock drill is reliable, economical and rapid in operation. The exhaust air from the mining pneumatic rock drill aids in the ventilation and it is claimed has little to fear from the competition of the electric drills.

The accompanying drawing, Fig. 1, shows the details of construction of a modern American pneumatic rock drill of the Chicago type in which the valve motion is of the "tappet" or "positive" motion design.

The tappet or rocker is forged from high-grade tool steel, accurately machined and hardened where it comes in contact with the piston and valve; it operates on a straight pin made from tool steel, working in renewable hardened steel bushings. To hold the pin in position endwise and also prevent leakage through bushings, steel plates are provided. These are let into the side

Fig. 2.

Fig. 3.

Fig. 4.

walls of the cylinder and locked in position by the under face of the valve seat.

It will be noted that the valve is of the lightest possible section consistent with strength. A chamber is provided in the valve seat to form an oil reservoir for the lubrication of the drill and a wicking leads the oil from the reservoir into a port of the valve seat. The pulsation of the operating fluid provided for continuous lubrication.

It will be noted that the cylinder is extended and is also provided with a boss or lug for the feed nut. It may be stated that piston rod and chuck are forged in one piece from high-carbon steel, and then put through an elaborate process of oil treatment and annealing which toughens and increases the tensile strength 25 to 30 per cent. Piston rings are made

up in two pieces, from special high-grade steel accurately machined, and are held to walls of cylinder by steel springs.

An important feature of this pneumatic drill is that the rotating mechanism is arranged to slip or release should the steel become bound in a hole while drilling in seamy or loose rock.

In mining and other service owing to the diversity of conditions under which and the various positions in which a rock drill has to operate, several holding devices have become recognized as standard, and these, owing to the nature of the service, must be simple, rigid, easily adjustable and of as light construction as possible, consistent with strength required.

The accompanying illustration, Fig. 2, shows the form of tripod used, while Fig. 3 shows the method of

Fig. 5.

operation. Wherever conditions will permit its use, the tripod is the mounting most largely used for rock drills, because of its ready adaptability to rough surfaces, its easy and very varied range of adjustment, its great strength and rigidity.

The accompanying illustrations, Figs. 4 and 5, show the use of the column, shaft bar or stoping bar, the former with single screw and the latter with double screw at the base. The illustration, Fig. 5, shows the double screw column and pneumatic drill in service at Ishpeming, Michigan, at the Cleveland Cliff Mines.

The column, either single or double screw, with its arm, clamp and safety clamp has a field of its own in tunneling, shaft sinking, stoping or drifting, and is of equal importance with the tripod as a rock drill mounting. The column can be made up to any desired length, but the usual lengths are six and eight feet, measured with the screws run clear in. It is made up of a heavy piece of tubing capped on its upper end, and provided with a foot piece suitable either for a single or double screw and the screws have a range of 6 to 12 inches, depending on the size of the column.

It may be stated that a drill may be mounted directly on a column or on the column arm, which gives a great range of adjustability. A safety clamp is provided and is fastened on the column under the swinging arm. This sustains the weight of the arm when loose and allows it to be safely swung into any desired position.

In mining work or in tunnel or shaft construction there is always employed wood blocking, not less than three inches thick, interposed between cap of column and wall, and between screws of foot block and wall. This provides for a secure and elastic fastening. All single screw columns are provided with a locking cap, which is constructed to securely clamp the jack screw, preventing it from loosening under the jar of operation.

The quarry bar or open-cut channeler is another style of rock drill mounting which was developed for quarry work, particularly in getting out "dimension stone," this problem calling for a portable apparatus which would drill a series of holes close together and "in line," and then be used to break down the walls between the holes, with a minimum of labour and time to make the necessary changes.

It is maintained that besides having a recognized place as a labour-saving device in quarry work, it also is largely used in open-cut contract work for "channeling" the sides of the cut, a class of work to which it is very well adapted.

### CORRESPONDENCE.

Editor Canadian Mining Journal:

Sir,—Before discussing Prof. A. P. Coleman's letter regarding the glacial origin of the Lower Huronian conglomerate at Cobalt, it might be well to concisely state both sides of the question. The facts for and against the proposition are briefly the following:—

For: (1) The presence in the conglomerate of pebbles whose scratches and markings are similar to those found in recent boulder clay. (2) The presence of large boulders (supposedly miles away from their source) in the fine-grained greywacke. (3) The widespread occurrence of the conglomerate. (4) Its similarity to the South African Dwyka. (5) Its general resemblance to Pleistocene boulder clay.

Against: (1) The conglomerates have not been

found resting on a glaciated basement. If Coleman attributes a glacial origin to the Lower Huronian conglomerates of the Lake Superior region, the absence of a glaciated basement there is significant, because this area has been studied in great detail by the United States geologists. (2) The scratched stones already discovered are known to occur in a very small area—a few acres, in fact. (3) Over widespread regions the fragments making up the lower part of the conglomerate have resulted from the breaking down of the adjacent rock. This much, at any rate, has not been transported by ice. (4) The scratched pebbles may have been produced by other causes. (For years the scratched pebbles in an English conglomerate were thought to represent glacial action. Recent studies have shown the scratches to have been produced by movement on talus slopes.) (5) The large boulders in the conglomerate may have been transported by agencies other than ice.

There is another point in regard to this question which needs consideration. If we recall the succession in the original Huronian area, it will be remembered that the Lower and Middle Huronian are both present. But each of these latter groups has lithologically similar conglomerates, except that the Upper group carries limestone fragments. Therefore the arguments for a glacial origin of one group apply equally well to the other. The logical question readily follows: Would Prof. Coleman have two distinct pre-Cambrian glacial periods? So far as I know, he has never discussed this aspect of the problem, and yet it would appear that such a question must be faced, especially since the stratigraphical position of the Cobalt conglomerate is tentative. It would consequently be interesting to have a definite list of those localities whose conglomerates are considered by Prof. Coleman to be glacial in origin.

In regard to the large granite or other boulders in the conglomerate "miles away from any known source," it is well to remember that in spite of their source being unknown, they may nevertheless have come very short distances indeed. In other words, we cannot tell what rocks underlie these boulder conglomerates, except where the contacts are actually seen.

Prof. Coleman's comparison of the boulder clay at Toronto is not an apt one, for the reason that the underlying rocks are comparatively soft shales and limestones. It is not to be expected that such materials would be so likely to show a glaciated basement. But the hard granites, limestones and cherts which everywhere underlie the Huronian conglomerate present an entirely different proposition.

If it is true that "the real test of glacial action is to be found in boulder clay and the glaciated stones in it," it is also true that Cobalt is the only place where these scratched stones have been found. But in spite of this fact, Prof. Coleman gives a glacial origin to "the thousands of square miles of boulder conglomerate in northern Canada reaching from Chibougamou to Lake Winnipeg."

It cannot be said that the suggestion of Van Hise regarding the finding of a glaciated basement ignores the fact "that near the edge of a glaciated area where the thickness of the ice is not great, the ice sheet often moves for miles over loose materials without ever reaching the rock surface beneath." It need not, surely, be pointed out to Prof. Coleman that these conditions are not widespread, and that an ice sheet that could leave such enormous masses of boulder clay as he believes

have been left, would certainly produce in many areas a perfect glaciated surface.

From the miner's point of view it matters little if the Cobalt conglomerate be of glacial origin. Moreover, there is nothing particularly original about the idea of a glacial period in pre-Cambrian times. Such an origin was considered many years ago for the Torridonian sandstones and conglomerates in Scotland. And five years ago we see from the following sentence (first edition Cobalt report, page 48) that Miller also had this theory in mind. "In the present state of our knowledge we have little warrant for claiming that the granite boulders, often two or three feet or more in diameter and distant a couple of miles from exposure of the rock, indicate glacial conditions during Lower Huronian times, although we have no proof to the contrary." But since then it is frankly admitted that the finding of pebbles, the scratches on which many glacial men think have been caused by ice, is of much interest. Nevertheless, the reasons why too great stress should not be placed on this point have already been pointed out.

Incidentally, it may be remarked that two of the most eminent glacial geologists—Chamberlain and Salisbury—have seen the Cobalt conglomerates. I am not aware that they are in accord with Prof. Coleman's sweeping conclusions.

Finally, the gist of the matter, with many of those whose opinions Prof. Coleman flippantly classes as "off-hand," will remain as it was—we look for a glaciated basement, and until that is discovered I repeat the statement that the subject will remain an open question.

Yours, etc.,

CYRIL W. KNIGHT.

Toronto, Nov. 23, 1909.

## PERSONAL AND GENERAL.

Mr. Clifford Smith, mining engineer, was in Toronto recently.

Mr. Boyd Magee has resigned the management of the Keeley mine and has opened offices in Toronto and Haileybury, as consulting mining engineer. Mr. Magee has had valuable experience in the development of mining properties, especially in the Cobalt region.

Mr. E. Jacobs, Secretary of the Western Branch of the Canadian Mining Institute, is in Nelson, B.C. Mr. Jacobs will probably remain in the Boundary region until January next.

Mr. C. H. Macnutt has assumed the general management of the Poderosa Mining Co, Ltd, in Chile.

Mr. J. M. Turnbull recently examined various mining prospects on the Queen Charlotte Islands, Swanson Bay, and the Portland Canal district on behalf of the Consolidated Mining and Smelting Company.

Mr. J. J. Harpell will return from England to Toronto for a short stay early in January.

Mr. Martin Nordegg leaves shortly for Germany. He will be absent for three months.

Mr. Howells Frechette, of the Mines Branch, Ottawa, passed through Toronto on his way to Ottawa last week.

Mr. R. B. Lamb, consulting mining engineer, passed through Toronto, on November 24. Mr. Lamb is associated with the C. L. Constant Company, 42 Broadway, New York.

Mr. J. E. McEvoy is in Victoria.

Mr. A. B. Willmott has returned from a professional visit to British Columbia.

Mr. E. A. Collins, B.Sc., president and general manager of the Vermilion River Copper Company, Massey, Ont., was married on November 24th to Miss Maud Walsh, of Kingston, Ont. Mr. and Mrs. Collins have our best wishes.

## SPECIAL CORRESPONDENCE.

### NOVA SCOTIA.

**Glace Bay.**—The Glace Bay Gazette, in its issue of the 17th November, had a thoughtful editorial on the present aspect of international and national trades unionism in Canada, called forth by the contemptuous references to Canadian nationalism which have characterized the speeches of the delegates to the American Federation of Labour Convention recently held in Toronto. The Gazette justly comments on the apparent loss of national self-respect which has been displayed by the applause given to reflections on our national aspirations made during the speeches of delegates from the United States. A Mr. Jerome Jones, of Atlanta, Georgia, referred to the national movement in Canadian trades unionism as "a national plague, which must soon be eradicated," and another delegate, a Canadian this time, mentioned several Canadian unions, notably the P. W. A. of Nova Scotia, as unions "which did not know enough to keep quiet" before the great ones from the United States who are trying to run our national affairs. The comment of the Gazette editorial on these treasonable utterances is so pertinent that we quote it in full:—

"The way we are building up a nation in Canada is attracting the attention of the world. We have established a system of government, a trade policy and an industrial system, without reference to American ideals. We are working out stupendous

problems in transportation without any American assistance. In fact, in all phases of national life we have learned to stand on our feet. If the trade unionists of Canada, or any considerable section of them, intend to step out from this national march of progress and submit to American domination, it will be the worse for trade unionism in Canada, for the time is not far distant when Canada will be populous enough and powerful enough so that her people will not submit to foreign dictation in their industrial life.

"At all events, if a large proportion of the organized workmen of Canada have definitely decided to abandon national aspirations and allow themselves to be swallowed by the unionism of the United States, even though it masquerades as international, they should, we think, have at least enough self-respect to insist upon the Americans using inoffensive language while in the swallowing act."

The foregoing, we feel sure, expresses the opinion of that portion of the Canadian population in which are bound up the fairest hopes of this Dominion, although it may not meet with the complete approval of those little Canadians whose mental calibre is too small to appreciate the destiny of their own country.

**Glace Bay, Nov. 20.**—The U. M. W. A. Strike.—Continuing the figures for the strike period into the month of November,

the Dominion Coal Company's production shows the following progression:—

|                            | Output. | Average daily Output. |
|----------------------------|---------|-----------------------|
| July . . . . .             | 136,000 | 4,200                 |
| August . . . . .           | 154,000 | 5,900                 |
| September . . . . .        | 180,000 | 7,200                 |
| October . . . . .          | 205,000 | 8,200                 |
| November 1 to 15 . . . . . | 108,000 | 8,700                 |

The highest daily output since the strike was obtained on the 11th November, when 9,770 tons was raised. The average daily output for the second week of the month was over 9,000 tons. The Hub Colliery (No. 7), which has been idle since the strike commenced, resumed operations about the 21st of the month, and with this mine producing it is probable the output will reach the 10,000 ton mark during the closing week of the month. This steady progression tells its own tale. No. 6 is now the only colliery that is not working.

### ONTARIO.

Cobalt, Nov. 20.—The new gold discoveries up in Porcupine Lake have been creating a great deal of excitement, and many prospectors have gone in to try and locate ground in this new territory. Some of the veins found are very extensive, and in several places free gold in considerable quantities is showing. A government engineer was sent up to look over the district and report on the discoveries that had been made, and another engineer will shortly be sent up to make a more complete examination than was possible in the first instance. The report states that the gold is found in milky quartz veins, the country rock being of schistose structure. Among the claims reported on are those of R. Bruce, in Tisdale Township, where the discoveries consist of a series of quartz veins varying in width up to 18 inches. They have been stripped for a short distance, and on the contact of one of the veins with the country rock free gold can be seen. It is stated that these claims have been sold to Messrs. Drummond & Dobie for ten thousand dollars. The largest vein so far found in the district was seen on the Wilson property. This vein has been traced for over 400 feet, and at one point it appeared to be over 100 feet in width. So far no work has been done in this section to prove up the veins, but it is understood that the parties who purchased the Bruce claims are sending in a force of men to develop their holdings. Another sale has also been negotiated whereby Herbert Fade sold four claims in Tisdale Township to an eastern company for twenty thousand dollars.

A short time ago the dynamite thaw house at the King Edward mine blew up, and although the concussion was severe and was felt for miles around, no serious damage was done. The electric current, however, was cut off at some of the mines for some time.

The White Reserve mine in the Maple Mountain district has started work again under new management. The mines were shut down a few months ago, largely on account of internal troubles among the directorate, and not on account of the physical condition of the mine. A short time before operations were suspended, a shipment of eight tons of ore was made, which assayed 4,280 ounces to the ton. The mine is fully equipped, and operations will be carried on steadily.

The concentrator at the Buffalo mine is now running by electric power brought from the plant being installed at Hound Chutes. The equipment supplying this power is, however, only a small temporary unit, and the main plant will not be in a position to deliver power for some time to come. The cyanide plant in operation at that property has been very successful, and the first shipment of bullion from the camp has been made from their mill. It amounts to thirty thousand ounces, representing a recovery of 80 per cent. from 8-ounce tailings. The company estimates that this plant will mean a saving of about five thou-

sand ounces per month. The consumption of cyanide is much less than was estimated.

Nipissing has completed surface prospecting for this season, and during that time one hundred men have been employed, and have run about 33 miles of trenches. This is the greatest amount of surface work that has yet been done for one year on this property. The results obtained have been very satisfactory, and altogether about 24 new veins have been discovered. Some of these are among the most important that have yet been found. One of the main veins is numbered No. 122, and a new shaft-house and ore-house are being erected on Nipissing hill, from which it will be worked. This vein was cut on the 80-foot level, and already about 300 feet of underground work has been done on it. On the surface it has been traced for over 800 feet, and carries high grade ore. These 24 new veins do not include the discoveries that have been made by underground development.

The first shipment from the district of North Cobalt since the Green-Meehan ceased shipping about two years ago has been made by the North Cobalt Mining Company. The shipment consists of about ten tons of high grade ore, which has been taken from the vein discovered some time ago. This property is controlled by the Jacobs Exploration Co.

One of the most important sales in the Gowganda district for this season was concluded a short time ago, when the Crawford property, which adjoins the Reeves-Dobie, was sold for one hundred thousand dollars.

Crown Reserve has declared its regular dividend of 6 per cent., with a 9 per cent. bonus, and an additional 10 per cent., making a total of 25 per cent. for the last quarter of 1909. This company only commenced to pay dividends in 1908, when they paid 4 per cent. in July of that year. When this last quarter's dividend has been paid for 1909 the Crown Reserve will have paid a total for the year of 70 per cent. on their issued capital, and since they started paying dividends a total of 90 per cent. For 1909 this represents a disimbursement of \$1,291,109.

The T. & H. B. has declared another dividend of 300 per cent.

The Muggley Concentrator is now being run by electric power supplied by the Cobalt Power Co. The mill has recently been enlarged, and will now have a capacity of 135 tons of ore per day. A contract was made some time ago with the La Rose for treating their dump, and this will be run through at the rate of about one hundred tons a day. At the present time the concentrator is treating ore from the La Rose, Silver Queen, Right of Way and City of Cobalt.

A new discovery has been made on the Little Nipissing property on Peterson Lake.

The annual report of the City of Cobalt Mining Co. has been issued, and states that during the year a total of 739 tons of ore, representing 456,091 ounces of silver, were shipped. The City of Cobalt is now in a much better position than it was a few months ago, due largely to the development in the Huronian slates, in which have been found large bodies of high grade ore. It is interesting to note that the T. & N. O. Commission has been paid \$69,772 in royalties, and that \$17,000 is still due them.

The Harmon Mining Co. has completed negotiations for the Peverley lease, which adjoins the Ophir property, and a force of men will be started to work in a short time to prospect the property. This same company is negotiating for several claims in the new gold fields, and if these are secured, active work will be started at once.

The accumulation of ore underground at the McKinley-Darragh has necessitated the cutting off of several of the drills, as there is enough ore in the mine to supply the mill, which is treating about 80 tons a day. The capacity of the mill is being increased to about 120 tons a day, and it will soon be completed. The mill, however, cannot be started on its increased capacity until the power is ready for delivery. Development work at the Savage is restricted on account of the same lack of power. This property has shown up very well during the past year, and

preparations are being made to carry on the work on a larger scale than formerly. The new shaft at the Savage has been connected up with the old No. 3 shaft at the 75-foot level. On the main vein a drift has been run for about 260 feet, high grade ore showing in the drift practically all the way. Another vein containing some silver has been found on the surface, and as soon as mining operations can be started a cross-cut will be run from No. 2 vein to cut it.

The Temiskaming mine is now doing practically all its work on the lower level, and exceedingly good results are being obtained. The work on the 300-foot level on the main vein has shown up some of the richest ore that has yet been found on the property. In places the vein is 12 inches wide, carrying high values in silver. No. 2 vein on the same level has been developed for over 100 feet with corresponding values. The wall rock is also well mineralized, which will give a large quantity of milling ore. The main shaft is now down 340 feet, and a winze is being sunk from the 300-foot level midway between No. 1 and No. 2 shaft. Shipments from this property will be restricted until the new concentrator is in operation. The Beaver property in the same section is getting good values, and it is understood that a shipment of high grade ore will be made in a few days. The Shamrock property has opened up several veins on the 200-foot level, some of which show good values in silver. This property is one of several operated by the Jacobs Exploration Co.

One of the largest deals in the South Lorrain district was consummated a short time ago, when a syndicate concluded the purchase of the Newman claim, which is situated a short distance from the Wetlauffer mine. One of the best discoveries in that section was made on this property recently, where a vein carrying good quantities of silver was traced on the surface for over 300 feet.

The Trinity Cobalt Mining Co., situated on the northeast side of Cross Lake, has been sold for twelve thousand dollars. Most of the property lies under water. A small plant was installed and a shaft sunk for about 70 feet. This property was started as a wildcat, and the shaft was sunk for its entire distance through clay. The company formerly operating this property got into financial difficulties, and work was stopped some time ago.

At the annual meeting of the Trethewey Company the directors declared a dividend of 15 per cent., making a total of 25 per cent. for the year.

Since Cobalt Lake has been working under its new management very encouraging results have been obtained. A few days ago a new vein was opened up. Where encountered it showed about 30 inches of mineralized area, and carried considerable quantities of high grade ore. It is important to note that the new discovery was made on the 190-foot level in the slate underlying the conglomerate.

It has been announced that the Argyle mine, which was closed down on account of litigation, will resume operations in December, and the shaft will be continued to the 300-foot level as rapidly as possible, and from that point cross-cuts will be run to pick up the veins that are known to exist. The court proceedings have been settled, and the property has been sold for \$37,000. It is understood that \$25,000 will be spent on development work, and that an entirely new plant will be installed. When work was closed down several good showings had been found.

The St. Lawrence Cobalt has ordered a small plant for its claim on Greenstone Island, on Sasaginaga Lake, and will recommence work. This company is capitalized at \$1,500,000, and has its headquarters in Buffalo.

The Temagami Reserve Mining Co. has acquired control of the Floyd and the Gavin Hamilton. The former is in West Coleman, and the latter situated in the Elk Lake district. Considerable work has been done on the Gavin Hamilton, and the shaft has been sunk for over 100 feet.

It is understood that a change has been effected in the control of the Cobalt Central, and that new interests now control the property. The old management has come in for considerable criticism on account of the fact that they have never issued a complete financial statement of the company's affairs. It is stated that the concentrator was built by money advanced by Nivens & Son who have been interested in the property for several years, and it is said that this indebtedness has been as high as \$160,000.

Although the new gold finds in the Porcupine Lake have diverted attention from the gold district in Beatty and Munro Townships, there is a good deal of work being done in this section. The fissures in which the gold occurs are running from 8 to 10 feet wide, and in these are many stringers of quartz which carry the values. The Painkiller Lake Co. now has a shaft down on the vein over 50 feet. On the surface this vein was only 18 inches wide, but at the bottom of the shaft it is now over 7 feet wide. All through are scattered stringers carrying high values in gold. Considerable work is also being done by the Treadwell Co., and good showings have been reported. The work done on the six Hyland claims has been productive of favourable results, and a larger force of men will be sent in to open up the properties. There will be a good winter road into this section, and during the winter one or two plants will probably be installed.

The main excitement in Cobalt during the past couple of weeks has been the sale of the Gillies Limit lots. This section has come in for a great deal of attention on account of the good finds made on the Young-O'Brien, Waldman, and York-O'Brien. These companies are rapidly developing their holdings, and the results obtained are largely responsible for the much greater interest displayed in the last sale. During the time since the announcement of the sale was made the Limit has been crowded with prospectors. There were several properties on which there were fairly good showings, which were expected to bring large returns, but the result of the sale has far exceeded expectations. Of the fifty-five lots offered for sale, 761 acres were sold for an aggregate of \$362,786, and the price per lot averaged \$9,810. As was expected, the bids were not very high in the western portion offered for sale, and from A64 to A81 lots were not disposed of. These prices are very greatly in advance of any bid at the former sale. The highest price paid was for A53, which brought \$35,100. The list of successful tenderers is as follows:—

A46, Grant, \$10,300; A47, B. Sawyer, \$7,355; A48, Fraser & Ogilvie, \$26,230; A49, S. D. Madden, \$7,600; A50, Ross, \$6,500; A51, B. Sawyer, \$16,667; A52, B. Glidden, \$7,300; A53, Fraser & Ogilvie, \$35,100; A54, R. Glidden, \$25,100; A55, A. Pierce, \$12,500; A56, McLaughlin, \$22,000; A57, A. J. Young, \$3,284; A58, Burrows, \$8,885; A59, A. Pierce, \$12,600; A60, A. Pierce, \$12,300; A62, Winch, \$3,250; A63, Deville, \$2,100; A64, Deville, \$2,900; A81, Beaumont, \$12,000; A82, Beaumont, \$7,220; A83, Ross, \$3,500; A84, A. J. Young, \$2,015; A85, Roberts, \$2,119; A86, A. Pierce, \$7,000; A87, A. Pierce, \$12,600; A88, Roberts, \$2,470; A89, Curry, \$2,750; A90, Bell, \$9,779; A91, A. Oakley, \$26,556; A92, Beaumont, \$12,110; A93, Beaumont, \$7,220; A95, Boyd, \$2,992; A96, Barnet, \$5,960; A97, Waldman, \$4,728; A98, Fraser & Ogilvie, \$2,000; A99, Waldman, \$2,000; A100, Russell, \$4,100.

**Kenora.**—One of the latest reports in this district to cause excitement is the rumour that the original operators of the Mikado mine on the Lake of the Woods were misled as to, or misjudged, the strike and dip of the lode and sank their incline shaft right through the auriferous belt into the black trap. The strike of the main lode is northwest and southeast from the shafthouse, the dip being towards the east. The incline shaft was sunk almost due north, and from the report received it would seem that it passes through the wall of the main lode about the 240-foot level into the black trap. Drifting was then begun, but was pushed west instead of east; so that the main lode was

not again located, and men were withdrawn from this drift and stoping was carried on from these levels, which were in the main lode; that is to say, above the 240-foot level, where the shaft passed the wall of the lode.

Major Vereker and Capt. Machin, M.P.P., have just returned from making a careful investigation of the property, and they both express themselves as being in favour of this view of the situation. The difference between the strike of the lode and the direction of the shaft taken into consideration with the dip of the lode to the east, would make this report seem reasonable, and would, moreover, account for the former report of the vein pinching out, for as the incline shaft approached the wall of the lode, which, by the way, is very indistinct and difficult to locate, it would naturally cut off a wedge-shaped area of the lode and give an appearance in the shaft of a gradual pinching out of the vein matter.

The prospector coming into the Lake of the Woods district with intent to pursue his calling can equip himself in Kenora for his trip for a reasonable expenditure. His outfit, consisting of the following items can be purchased in town for the listed prices:—

|                                     |        |
|-------------------------------------|--------|
| 6 x 8 Tent .....                    | \$5.00 |
| 2 Pair blankets .....               | 7.00   |
| 1 16-foot canoe (second-hand) ..... | 35.00  |
| Pack sack .....                     | 3.50   |
| Compass .....                       | 1.00   |
| Prospector's pick .....             | 1.00   |
| Fry pan .....                       | .35    |
| 2 Pots .....                        | .60    |
| Fishing Tackle .....                | .90    |
| Axe .....                           | 1.00   |
| 22 Rifle .....                      | 8.00   |

If, in addition, the prospector decides to carry dynamite, he may purchase it from either of two companies in town, the Hamilton Powder Co. or the Ontario Powder Co. His steel will cost him 10½ cents per lb., striking hammer 12 cents per lb.; Bellows, 28-inch, \$9.00; bellows, 24-inch, \$5.50; anvil, \$5; shovel, \$1.25. It is almost unnecessary, however, for the prospector to carry dynamite, because no matter where he may be in this district, it is almost always merely a short canoe trip to some point where powder can be obtained.

The openness and adaptability of this country for prospecting can only be fully realized by those who in other districts have had to pack their stuff mile after mile through rough country, where the undergrowth tears the packs off their backs rather than let them through. Here in this district the Lake of the Woods and the adjacent bodies of water have such a number of arms extending into land that the prospector can always make camp on the lake shore and avoid the heavy packing so universal in other districts.

Moreover, if not satisfied with the Lake of the Woods as an arena for his activities, he can paddle into Shoal Lake, from there into Indian Bay, up the Falcon River into Falcon Lake, portage from Falcon Lake into either High Lake, Little High Lake or by means of two small lakes into West Hawk. From West Hawk Lake he can portage into Star Lake or Cross Lake to the westward, or Long Pine Lake to the east. From Long Pine a half mile portage takes him to Macara Lake, heading north, and from the eastern end of Long Pine he can portage to Harvey Lake. A creek connects Harvey Lake with Whitefish; a portage, and two small lakes and a creek connect Whitefish to Malachi Lake. To the east of Malachi we come to Duck Lake; after traversing this lake we portage into Pelican Pouch, where there is the division point of the two routes returning to Kenora, one striking the Winnipeg River, after traversing Lakes Catherine and Culloden, which has two terribly long portages; the other reaches Keewatin two miles from Kenora, after traversing Pickerel, Greenwater, Rosina, Bell, Lulu and Middle Lakes. At Keewatin a 200-yard portage places the pros-

pector once more on the Lake of the Woods, where he can paddle into Kenora after a round trip of 150 miles, where his longest portage has been two miles, but the greater number of his portages have been under a quarter of a mile. With regard to the prospecting already done in this district, I may say that hardly any prospecting at all has been done on this Falcon River route, with the exception of Star Lake, whose western shores have been fairly well gone over; in fact, this district has received but scant attention from the prospector, in spite of the remarkably good showing of those few claims which have been located in this West Hawk area.

#### BRITISH COLUMBIA.

**Rossland.**—Ore shipments from this camp during the past couple of weeks have been averaging about 5,500 tons per week. The shipments from the Le Roi 2, Ltd., are running in the neighbourhood of 450 tons of \$23 ore per week, and particular interest attaches at this time to the shipments from the Le Roi mine, which are said to be of a grade of ore that will average \$60 and over per ton in gold. The Le Roi for the week ending October 30th shipped 735 tons of this class of ore. At present the product of the Le Roi mine is being treated at the Consolidated smelter at Trail, B.C., the tonnage not being great enough to warrant the resumption of work at the company's own smelter at Northport. It is generally understood, however, that if the new finds of ore in the portions of the Le Roi mine now undergoing development prove on further investigation to be extensive and sufficiently rich, then the company will start up the Northport smelter. By the time this came about there is no doubt that the Velvet-Portland lessees would be in a position to send a steady tonnage to the Northport smelter, to say nothing of several Washington copper mines that would be glad to contribute custom ores. One of the diamond drills has been taken from the depths of the Le Roi, as a number of minor strikes have been made that the management feel should be drifted on before anything else is done. More machine drills have been added to the working force, and the other two diamond drills are running steadily.

With the advent of cold weather the hopes of the lessees of the smaller mines around this district have fallen somewhat, and work has been discontinued in the South Belt. The Blue Bird Mining Co. has not followed out its intention of doing development work to depth on the rich ledge recently opened up on its property. It is to be hoped that this enterprise will not be dropped, for upon development work in the lower levels depends the future of the South Belt, where several rich surface veins have been worked in a small way for years. The opinion has been expressed by several eminent engineers that good mines will be found some day in this debatable district.

**The Boundary.**—The ore shipments from this district lately have been record-breakers in the history of the Boundary copper section, and indicate the marked progress that has been made in the copper mining situation here during the past eighteen months, despite the many disadvantages that the local companies have had to contend with, such as the low price of copper, strikes in the coal fields, car shortages, etc. For the week ending October 23, the Granby Phoenix mines shipped 27,573 tons, the heaviest shipments in the history of the mines, and exceeding the February high-record mark of this year by over 2,000 tons. During the week ending October 30th the Mother Lode mine of the B. C. Copper Co. shipped 11,572 tons, making a new high record. The Oro Denoro mine of the same company has been shipping as high as 1,200 tons per week, and shipments from the Snowshoe property, controlled by the Consolidated, have crept up to the 5,050 mark. Seven of the enlarged furnaces are working at the Grand Forks smelter, treating nearly 26,500 tons of Granby ore per week. At this rate of treatment, if it is maintained, it looks as though the prophesy of the Granby management, that they would make copper this year at

a figure lower than 10c per lb., would be fulfilled at the end of the current fiscal year.

It will be remembered that when the Dominion Copper property was first offered for sale that the Granby, B. C. Copper and Consolidated Companies considered acquiring it, and rumour had it that a figure of over \$300,000 had been offered for the property, but was refused. At the sheriff's sale in Vancouver the property was sold for \$261,500. There were no bidders outside of the New York men who had a representative present. Why no other bids? Probably we can guess. There may have been a master mind behind the whole affair. By a little aerial mining legerdemain the old shareholders were shaken off. The new concern was organized, and now the B. C. Copper practically acquires control of that property by securing 132,000 of the 250,000 shares of stock, paying for it with about 80,000 shares of its own stock and the balance cash. That's surely cheaper than \$300,000! Again, a prominent New York copper capitalist secures a seat on the directorate of the B. C. Copper Co. He practically controls New Dominion Copper. Then two of the B. C. Copper officers secure seats on the Board of the Dominion Co. It is announced, also, that one of the big copper syndicates in New York is interested in both B. C. Copper and New Dominion Copper. When prices were low these men bought heavily of B. C. Copper. It is still being picked off the local market, and there is little or no New Dominion Copper offered. It looks as though the New York syndicate saw a chance to get a couple

of good low-grade copper properties at a bargain by a little skillful work—and got them. We take off our hat to the master mind behind, and watch the chessmen to see what next move the hand from the cloud will make.

At the present time the three furnaces of the B. C. Copper Co. are working full force smelting nearly 2,000 tons of Mother Lode and Oro Denoro ore per day. The smelting facilities at the Greenwood smelter will be enlarged, however, before long. This will be necessitated by an arrangement to treat ore from the New Dominion mines and by shipments from mines of the B. C. Copper Co. that will be opened up by the new spur or branch of the Canadian Pacific from Hartford Junction to Wellington camp, where this company owns the Jackpot group, and has a good tonnage of ore awaiting shipment. The president of the B. C. Copper Co. states that with the increased amount of ore treated, and with the added smelter facilities the company can make copper for less than nine cents per pound. While this may be necessary, in order to make any kind of a profit on Dominion ore we would point out that the Granby Co., which has every facility, and is at present treating close to 4,000 tons per day, were only able to cut their cost to 10c for the year ending June 30th, 1909, and which was only .0024 lower than for the previous year. The Granby ought to reduce their 10c cost this year, however, and no doubt will do so unless some labour or fuel trouble interferes. This cost figure covers mining, smelting, converting and marketing, with gold and silver deducted.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

Halifax.—The conspiracy case, arising out of charges brought by the U. M. W. A. against Nova Scotia coal operators, particularly the Dominion Coal Co., has been postponed to November 30th.

Sydney.—In order to meet the demands for raw material which the enlargement of their plant now in progress will entail, the Dominion Steel Co. has decided to place an order in England for two 10,000-ton steamers for delivery about a year hence. The new steamers will be specially designed for carrying ore from Wabana mines to the plant at Sydney.

### ONTARIO.

Ottawa.—The appropriation for the fiscal year 1910-11 for the Geological Survey are as follows: For explorations and surveys, \$140,000; for publication of reports, maps, etc., \$75,000; for purchase of books, instruments, laboratory apparatus, etc., \$40,000; to pay for specimens for Victoria Museum, \$10,000; for temporary, technical, and clerical assistance, \$2,000. The total is \$267,000, an increase of \$27,000 over 1909-10. The Mines Branch appropriation is \$79,500, which is \$2,000 less than the appropriation for the current year.

### ALBERTA.

Frank, Alta., Nov. 10.—With the ratification in Frank of the reorganization of the Canadian-American Coal & Coke Company, what is probably the most important deal in relation to coal mining in Western Canada will have been consummated, as it will bring into the coal industry of this country the most eminent coal mining man of France as well as a number of other French financiers of almost equal prominence and importance.

The head of the new concern will be M. Maurice Tilloy, of Paris, President of the d'Ostercourt mines of France, Director in the Mines de Lens of France, and member of what is known

as the Collieries Committee of France, which formulates the laws providing regulations for coal mines in that country.

Associated with M. Tilloy as officers and directors of the new company will be: First Vice President, O. L. Liegeart, President of the old Canadian-American company; Second Vice-President, Baron de Bellicize, Director of the Schwitz Bank of Paris; Treasurer, General G. C. Avon; additional Directors, Felix Colomer, Consulting Engineer of the old company; Jacques Bernard, Director of the Sultanats of Haut-Oubanghi, a French syndicate trading in Africa, also Director of the Franco-Norlandais of Culture and Trade, a bank of Paris; Leon Clere, Director of one of the largest oceanic transportation companies of France, with headquarters at Havre, and S. W. Gebo, one of the founders of the Canadian-American company, who will be managing director.

With the final consummation of the reorganization the old Canadian-American Company passes out of existence even as to name, as the new company is known as the Canadian Consolidated Coal Company. The capital is reduced by \$500,000, the old company having being capitalized at \$2,500,000, while the capital stock of the reorganized company is approximately \$2,000,000. The company is being incorporated in England, with head offices in London, and is capitalized at 400,000 pounds, with 80,000 shares at par value of 5 pounds each.

In the allotment of stock under the reorganization the shareholders of the Canadian-American Company receive one share of the new stock for 10 shares of the old, leaving 30,000 shares of treasury stock, or \$75,000 subscribed and paid in, to be devoted to the improvement and further development of the company's property here. Of this \$750,000 cash now in the treasury, \$180,000 is to be devoted to new work, \$140,000 to liquidation of the outstanding liabilities of the old company and \$220,000 to reimbursements of the bonds of the old company leaving a working capital of 7,210,000.

The reorganization has already taken place and only awaits

formal ratification by the shareholders of the Canadian-American Company. This will occur at the stockholders' meeting to be held in Frank Monday, when virtually the whole of the stock of the old company will be voted in approval of the new deal.

Alfred Muller, general manager of the Canadian-American Company, and who was appointed liquidator of the concern, will be the general manager of the reorganized company.

One item in the new work planned is the building of a battery of 200 coke ovens. They will be of the new Belgian type of oven, except as to four which will be the Solvay-Copie by-product ovens, from which will be obtained tar for the manufacture of briquettes, and the gas from which will be used under the boilers of the power plant.

Another will be the erection of a new steel tippie at the present shaft with a handling capacity of 2000 tons in eight hours, and over which the entire output from the various openings will be handled. The tippie will have a modern screen rig and only the various grades of screened coal will go to the market, while the slack will go direct to the coke ovens, which will have a capacity of 500 tons of coke a day.

Another item will be the installation of an electric plant to supply power for operating the old mine, the new tippie and the company's sawmill, while another will be the building of a \$60,000 sanatorium building at the sulphur springs owned by the company at the western limits of the village.

The foundation for a 100 foot extension to the power house are now in progress for the accommodation of additional boilers, the electric plant and compressed air plant. The foundations are practically completed and will be ready for the installation of two boilers of 250 horsepower each, which are expected to arrive by December 1. The air compressor and a 500 kilowatt generator are expected to follow within a few weeks and will be installed the first of the year. The other improvements determined upon will be proceeded with at the opening of the spring.

In connection with the plans for further development of the coal measures, as soon as the compressed air plant is ready for service, the sinking of a slope on the old working seam will be started, and from this two large seams, one to the East and one to the west of the present working seam, will be opened. Later in the year, according to the plans, the sinking of a new shaft will be started and a new system of haulage installed, probably that of gasoline engines.

It is the expectation of General Manager Muller that by the expiration of 1910 the company will be in the market with an output of anywhere from 1500 to 2000 tons of coal and 500 tons of coke a day.

#### BRITISH COLUMBIA.

**Greenwood, B.C.**—Work on the coal property west of Midway, owned by the Boundary Mining Company, has been going on interruptedly since September 1 with very gratifying results. Some surface work has been done prior to that date and a number of showings were located. A shaft was then sunk to a depth of sixteen feet, cutting through the coal seam, which was about five feet in thickness at that point, to a sandstone bedrock. From this point the seam was followed for sixty-five feet. This shaft was intended for prospecting only, and proved the continuance of the seam to depth between clean and well defined walls.

At the present time work is being done on a tunnel from the flat below the bluff where the shaft was sunk. The tunnel will crosscut the coal seam at a depth approximating 150 feet and will open an enormous area from which coal may be taken by drifting. The mouth of the tunnel is about thirty-five feet above the level of the Canadian Pacific tracks, so that the handling and shipping of the product may be done over a gravity tramway.

The company has secured options on over 1,000 acres of land in the vicinity where the surface indications and the formations point to the presence of coal. It has also staked three square miles to the west of its present holdings, on which it will secure a lease from the government. Arrangements are now being made to secure a drilling outfit to prospect this extensive area. The location of the present workings is on land owned by the company, comprising 500 acres and including some very valuable ground along the Kettle River.

In addition to the coal activity in this locality, it is learned that the Ingraham Creek timber limits are to start immediately upon the erection of a mill, which they expect to have in operation before summer. They have taken an option on ten acres of land owned by the Boundary Mining and Exploration Company, which they propose to use as a site.

**Vancouver**—Reports from the Portland Canal Mine state that the ore cut by No. 3 tunnel shows up well in native silver.

## MINING NEWS OF THE WORLD.

### ONTARIO.

**Cobalt.**—The following extracts from a letter issued by President Carson, of the Crown Reserve, are of interest:—

Mr. Cohen, our manager, has not sold out his holdings in Crown Reserve to myself nor to anyone else, but has still a very substantial holding of stock in our company.

Work has not been stopped on the main or Carson vein, but is progressing as usual.

Our shipments have not fallen off. We have during the whole of this year shipped two cars of high-grade ore per month, and from seven to ten cars of low-grade ore per month. Our shipments so far this month consist of one car of high-grade ore, one shipment of bullion, and four cars of low-grade ore.

The main vein over the 100-foot level is not half stoped out, nor is the one at the 200-foot level of very inferior grade. Our values keep very rich at the 200-foot level, and we are quite satisfied with the prospects of our property.

The statement that we have not been able to find any bonanza deposits emanating from the Kerr Lake property may or may not be true, but one fact is true, namely, that we have

cut vein No. 15 assaying 4,031 ounces, vein No. 16 assaying 4,396 ounces, vein No. 17 assaying 4,336 ounces, vein No. 18 assaying 8,528 ounces, vein No. 21 assaying 2,225 ounces, and vein No. 24 assaying 6,480 ounces, the whole in our cross-cut to the north of the Kerr Lake line.

We have \$7,000,000 worth of ore blocked out on our main vein down to the 200-foot level. We also know that we have ore in vein No. 14 assaying 12,895 ounces, and in the six veins named in paragraph five a very large asset in addition to our main vein.

We have never been bothered in any shape or form with water in our mine; in no place are our workings in the slightest danger, and our main ore body can be extracted absolutely to its roof, for the very simple and satisfying fact that nearly the whole of it is in absolutely dry land.

Finally I would say that the directors of the Crown Reserve Company have never used their property or holdings for stock jobbing purposes. Our mine has been run honestly in the interests of our shareholders. We are one of the few mines in Cobalt who issue a quarterly statement of our workings to our

shareholders, and these statements are also accompanied by maps showing our surface and underground workings. We have in charge of our property an able and capable engineer, who has the full confidence of such an eminent and disinterested expert as the gentleman who has not sufficient confidence in himself to write his article over his own name, but who hides himself under the name of the celebrated mining town of Cobalt.

#### UNITED STATES.

##### California.

A suit is pending in the oil districts of Kern County. The point to be decided is whether the filing of a mineral claim on oil land does or does not give the locator any preference right to possession in advance of the actual discovery of oil. If the decision is in the negative, the ground will be open for all to explore, priority of discovery being the only advantage.

##### Utah.

The Denver & Rio Grande Railway has acquired much new equipment, including eight new Mallet compound locomotives, to handle the increased output of ore from Bingham.

##### Montana.

Butte Coalition has declared its first dividend since December, 1907. At that date a dividend of 15 cents per share was paid. The present dividend is at the rate of 25 cents per share.

#### GREAT BRITAIN.

It is reported that the Buenos Ayres and Rosario Railways have placed orders for 200,000 tons of large coal with the Standard and Lewis Merthyr Coal Companies for delivery over the whole of next year at 15s 10½d per ton f.o.b., or about 2s per ton above the figures paid last year. It is also stated that one of the largest Admiralty coal collieries has just concluded negotiations for the supply of half a million tons of large coals at a price slightly under 16s 9d f.o.b. The figures obtained in all cases are considered decidedly good.

The workmen's side of the Welsh Coal Conciliation Board on November 1st formally notified the owners' side of a demand for an advance of 2½ per cent. in the wages of the miners in the Associated Collieries as from 1st December next. Wages now stand at 47½ per cent. above the standard rates of December, 1879. The statutory meeting of the Conciliation Board to consider this application will be held on Wednesday, 10th November.

The Middlesbrough Customs return of iron and steel shipments from the Tees ports during October shows the best month's trade this year owing to the demand from America for Cleveland pig-iron. The total shipments of pig-iron were 115,900 tons, exclusive of about 12,000 tons from the Cleveland port of Skinningrove, and 19,780 tons went to the United States and 9,019 tons to Canada. The inquiries in the market on American account give promise of increasing trade across the Atlantic. The other best over-sea customers for pig-iron were: Germany, 12,009 tons; Italy, 10,851 tons; Sweden, 7,973 tons, and Japan, 5,297 tons.

The exports of manufactured iron and steel, mainly railway material, galvanized sheets and joists, were: Manufactured iron, 9,589 tons, and steel, 43,464 tons. Argentina took 7,183 tons, Canada 3,459 tons, Cape Colony 7,938 tons, Natal 2,733 tons, Portuguese East Africa 1,562 tons, South Nigeria 1,731 tons, Egypt 419 tons, India, 7,100 tons, Japan, 1,764 tons, New South Wales 1,017 tons, South Australia 2,760 tons, Victoria 773 tons.

#### MEXICO.

An option on the Santa Gertrudis silver mine, Pachuca, has been obtained by the Camp Bird Company. The Santa Gertrudis has two reduction plants. At one the Boss system of amalgamation is installed; at the other the Patio process. The

ore carries 5 grammes gold and about 60 ounces silver. About \$8,000,000 worth of ore is in sight.

#### SOUTH AFRICA.

Johannesburg.—The annual meeting of the Johannesburg Consolidated Investment Company was held on November 2nd Mr. Charles Marx being in the chair. The net profit on the year's operations after allowing for depreciation and writings off is £478,000. The amount carried forward after deduction of the 10 per cent. dividend already declared and paid is £162,000 including £79,000 brought forward from the last account. The balance-sheet reflects assets of £5,464,000 and liabilities to the public £707,000, the surplus of assets being \$4,757,000, of which £1,639,000 is regarded as liquid. The aggregate market value of the shareholdings is estimated at the date of the meeting to be £1,500,000 in excess of the book value. The Municipal Council valuation of the real estate exceeds the book value by £500,000. The aggregate value of the gold won during the financial year by the producing mines of the group was £2,274,000, and of the dividends distributed £680,000. The average working costs show a further reduction, which would have been greater but for the shortage in native labour, an improvement in which is expected. Good results are anticipated from the company's large interests in the Consolidated Langlaagte Mines, Ltd., the Randfontein Deep, Ltd., and the Van Ryn Deep Ltd., the finances of which mines have now been placed on a satisfactory footing. The position of the Johannesburg Consolidated Investment Company, Ltd., is regarded as exceptionally strong, and the statement as the best ever presented to the shareholders. The maintenance of regular dividends is anticipated.

Sympathetic reference was made by the chairman to the impending unification of South Africa, which was confidently expected to further general prosperity.

The report and accounts were unanimously adopted, and a special general meeting approved and adopted the amended articles of association as submitted.

Johannesburg.—Mr. C. Waldie Pearson, chairman of the Western Rand Estates, presiding at the annual meeting, severely criticised the authorities for refusing to make retrospective the clauses under the new Gold Law relative to the allocation of discoverers' rights as a reward for exploration by boring operations. Investigation of the position, however, goes to show that the company has been generously treated and has secured 2,540 mynpacht claims.

It is understood that two tenders have been received by the Government for leasing the two claim areas on the farm Modderfontein recently offered by the Government. One is stated to be on behalf of a syndicate of London capitalists in which the Consolidated Mines Selection Company is reported to be interested. The Government's decision on the offers is expected in about a fortnight.

The recent developments in the Village Deep on the main reef leader at the 18th level show a value of 23 dwts. over 42 inches.

Several quarterly reports are now available. The City Deep shows a development of 291,284 tons, averaging 8 dwts. The Bantjes Consolidated's payable development gives 86,005 tons averaging 9½ dwts. The subsidiaries of the Consolidated Gold Fields, Ltd., show a depletion of 340,000 tons in their reserve owing to scarcity of native labour available for development purposes.

#### NEW ZEALAND.

Wellington.—The output of gold in New Zealand during the month of October amounted to 49,906 ozs. valued at £198,366, as compared with 31,026 ozs. valued at £124,015, for the corresponding month of last year.

The output of silver during October was 153,167 ozs., valued at £15,281, as compared with 131,343 ozs., valued at £13,204, during October, 1908.

### AUSTRALIA.

Sydney.—A general strike of waterside union workers is threatened in sympathy with the strike of the Federated Coal and Shale Workers of Australia. Many of the collieries have been closed. It is doubtful if the men can finance the strike.

Sydney.—The gold yield of New South Wales during October amounted to 25,212 ozs., valued at £94,210, as compared with 24,788 ozs., valued at £93,272, during October, 1908. The yield for the ten months was 201,870 ozs., valued at £735,285.

Perth.—Following is the wording of cable announcing to the Great Boulder Perseverance Gold Mining Company the destruction of its plant:—

“At 1.30 fire started in main engine room. Following items destroyed: Air compressor building, engine room, Griffin Mills building and ore bins. Partially destroyed: Boiler house, dynamo house, buildings containing furnaces. Believe that fire is under control. Telegraphing to you later.”

The secretary states that the mine is fully insured.

Perth, W.A., Nov. 10.—Fire is raging in the surface workings of the Great Boulder Perseverance mine. The damage is estimated at £300,000. The adjacent mines have suspended operations and are concentrating their water supply on the fire.

Later.—It is now believed that the damage done by the fire at the Great Boulder Perseverance mine will not amount to more than £50,000.

Sydney, Nov. 10.—The men at four southern collieries have struck. Coal is selling at 50s a ton and the price of firewood has advanced 50 per cent. The proprietors declare that they will not confer with the men's representatives under threat.

Thousands of men have been rendered idle in other industries. The northern strikers have decided to picket the mines and thus to prevent repairs or baling. Great damage will be done as the result.

The P. & O. Steamship Company is prepared to import large supplies of coal from Japan.

The men at three additional southern mines have struck, and work is now going on at only three southern mines.

The Broken Hill miners have voted £1,000 to the strike fund and recommend a levy of 3s 6d per member weekly.

Sydney, Nov. 10.—Replying to a question in the Legislative Assembly to-day, Mr. Wade, the Prime Minister, said that the Government regretted the miners' strike, which would involve countless people in Australia, unless threatened developments were modified. The Government was greatly impressed with the gravity of the situation and alive to its obligations. The question was, could a method be devised by which the parties concerned could in the public and their own interests adjust the grievances, existing or alleged, by giving time for the employment of peaceful methods? He did not suppose that the Industrial Disputes Act was lifeless. In view of a possible immediate conference, it would be unwise to set the criminal law in motion, but if a determination to force war upon the community were manifested, the Government would without hesitation do its legal duty. The Prime Minister proceeded to appeal to the northern and southern colliers to retrace their steps, and to the western miners not to jeopardize the prospects of the expected award by the Wages Board upon their claims. He urged the waterside labourers not to break existing agreements, and reminded all that the power of outraged public opinion was greater even than that of Parliament. When the public came to realize that they had been victimized and made to suffer for unsubstantial grievances which could be redressed peacefully they would rise in their power and majesty and insist that public interests stood above all others. The strike, he continued, might paralyze the whole of the transport service of the Commonwealth, including the carriage of the wool and wheat harvests, and prevent food supplies—even milk for the children—from reaching the people. In conclusion, Mr. Wade appealed to the public to exercise patience and have confidence in the Government, which would perform its duty, being determined to favour no section, but to vindicate the people's rights.

Mr. McGowan declared that the Labour Party was in full accord with the Government's decision to allow the parties to confer together.

Melbourne, Nov. 10.—Owing to the coal strike, the interstate shipping companies have substantially increased their freight charges and fares, and are considering the question of laying up many of their passenger steamers at an early date.

## STATISTICS AND RETURNS

The Nova Scotia Steel Company's output of coal during 1909 will be about 800,000 tons, while ore will total about 450,000 tons. President Harris states that the company has made contracts for the sale of ore in 1910 to the extent of about 300,000 tons. He states that the submarine areas are being steadily worked, and that the "faults" encountered have not been serious.

### COBALT ORE SHIPMENTS.

The following are the shipments from the Cobalt camp for the week ending November 19th, and those from January 1st, 1909, to date:—

#### TORONTO MARKETS.

##### Metals.

Nov. 25—(Quotations from Canada Metal Co., Toronto.)

Spelter, 6 1-2 cents per lb.  
Lead, 3.75 cents per lb.  
Antimony, 8 1-2 to 9 1-2 cents per lb.  
Tin, 32 1-2 cents per lb. (very active).  
Copper, casting, 14 cents per lb.  
Electrolytic, 14 cents per lb.  
Ingot Brass, 9 to 12 cents per lb.  
Lake Copper, 14.50 (copper market very active).

Nov. 25—Pig Iron—(Quotations from Drummond, McCall Co.)

Summerlee, No. 1, \$24.00 (f.o.b. Toronto).  
Summerlee, No. 2, \$23.50 (f.o.b. Toronto).  
Midland, No. 1, \$21.00 (f.o.b. furnace).  
Coal Anthracite, \$5.50 to \$6.75.  
Bituminous, \$3.50 to \$4.50 for 1 1-4 inch lump.

##### Coke.

Nov. 23—Connellsville coke (f.o.b. ovens).

Furnace coke, prompt, \$2.90 per ton.  
Foundry coke, prompt, \$3.00 to \$3.25 per ton.

Nov. 23—Tin (Straits), 31.35 cents.

Copper, prime Lake, 13.75 cents.  
Lead, 4.40 cents.  
Electrolytic copper, 13.50 to 13.62 1-2 cents.  
Copper wire, 15.00 cents.  
Spelter, 6.42 1-2 cents.  
Sheet zinc, 8.50 cents.  
Antimony, Cookson's 8.37 1-2 cents.  
Aluminium, 23 to 24.00 cents.  
Nickel 40.00 to 49.00 cents.  
Platinum, \$29.50 to \$33.25 per oz.  
Bismuth, \$1.75 per lb.  
Quicksilver, \$51.00 to \$52.00 per 75-lb. flask.

## Richard's Ore Dressing

### Volumes III and IV

Per Volume \$5.00 [21s] Net Postpaid

The Set, 4 Volumes, \$20.00 [£4 4s] Net Postpaid

NOTICE—The index for all four volumes will be issued separately and supplied free at an early date to all purchasers of Volumes III and IV.

It required two large volumes to cover the new machinery, processes, discoveries and data in ore dressing. These volumes supplement but do NOT SUPPLANT I and II.

In general arrangement Volumes III and IV are similar to Volumes I and II. The Chapters are each intended to supplement the subject-matter of the corresponding chapters in the earlier volumes, describing new machines, new processes, and giving new data. The greatest care has been exercised in avoiding repetition.

Since the issue of the earlier volumes, many important discoveries have been made and radical departures introduced in established processes. Volume III, for example, has complete discussions of fine grinders, particularly the tube mill and grinding pans, rectilinear tables of the Wilfley type, the questions of magnetic separation, electrostatic separation, the flotation processes, and other subjects of like importance not covered in the earlier volume.

When Volume I was issued, the tube mill, which has almost revolutionized gold and silver milling practice, was

hardly touched upon. The Wilfley table was just finding its place among mills, and a number of other tables of the same type have been developed since.

Volume IV describes in detail some 94 complete mills, showing the most approved modern and successful methods of applying ore-dressing principles in use to-day throughout the mining districts of the world. Comparisons are made with earlier descriptions to show modifications and improvements, and to point out errors in older plants.

Throughout both volumes, much space and great care have been devoted to the general subjects of costs of operation, speed, capacity, water power, life of machines, etc. Power and water plants are described in connection with nearly every mill.

Complete Bibliographies are added. The Index for the entire four volumes has been remade and will be bound separately. It will be furnished without charge to purchasers of Volumes III and IV.

Book Dept. Canadian Mining Journal - Toronto

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

# GEOLOGICAL SURVEY

## PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, and with many local areas and special subjects

**MARITIME PROVINCES**

The whole of Cape Breton, and a large portion of the coal and gold fields of Nova Scotia, have been reported upon, and mapped on a scale of 1 mile to 1 inch. The remaining portions of the Province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter Provinces, mapped on a scale of 4 miles to 1 inch.

**QUEBEC**

Quebec, south of the St. Lawrence, has been reported upon, and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the Province north of the St. Lawrence are also available.

**ONTARIO**

A large part of the Province of Ontario, more particularly the northern and western portions, has been reported upon and mapped

**THE PRAIRIE PROVINCES**

Geological maps and reports have been issued covering the greater part of the Provinces of Manitoba, Saskatchewan, and Alberta

**BRITISH COLUMBIA**

The southern portions of British Columbia, as well as other parts of the Province, have been reported upon and mapped.

**YUKON**

Many of the important areas in the Yukon have been reported upon and mapped.

**THE NORTH WEST TERRITORIES**

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost, and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

*Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

**THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:****CANADA**

1084. General Geological Map of Canada. Scale 100 miles to 1 inch.

**NOVA SCOTIA**

1019. City of Halifax Sheet.  
1025. Waverley Sheet.  
1037. Windsor Sheet.

The above sheets belong to the regular series of Nova Scotia map sheets on a scale of 1 mile to 1 inch. The first includes Halifax City and Harbour, the second the Waverley Gold District, and the third Gypsum Quarries.

**ONTARIO**

1023. Geological Map showing position of Corundum-bearing rocks in Central Ontario.  
1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

980. Portion of Algoma and Thunder Bay districts, Ontario, 1908. W. J. Wilson.  
1081. Region lying north of Lake Superior between the Pic and Nepigon Rivers, Ontario, 1906. W. H. Collins.

**BRITISH COLUMBIA**

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shows the geology and location of veins.

1004. Geological Sheet, Rossland Mining Camp. Scale 1200 feet to 1 inch.  
1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch.

**YUKON**

1041. Geological and Topographical Map of Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of same belt.  
NOTE.—Maps recently published may be had on linen cloth, for use in the field, at 10c. per copy.

**REPORTS**

1072. Summary Report of the operations of the Geological Survey for year 1908.  
1085. Descriptive Sketch of the Geology, and Economic Minerals of Canada. G. A. Young. Introduction, R. W. Brock.  
1075. Gowganda Mining Division, 1908. W. H. Collins.  
1035. Coal Fields of Manitoba, Saskatchewan, Alberta, and Eastern British Columbia, 1908. D. B. Dowling.  
1050. Whitehorse Copper Belt, Yukon. R. G. McConnell.

**NEW CATALOGUE**

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

**Miners' Certificates** good for a calendar year may be obtained by sending \$10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of \$10.00 plus a yearly rental of \$1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed

territory may be purchased as a mining concession at the price of \$20.00 per acre if within 20 miles of a railway in a straight line, or \$10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

**The Hon. Minister of Colonization, Mines and Fisheries  
Quebec.**

## Province of Nova Scotia

**Leases for Mines of Gold, Silver  
Coal, Iron, Copper, Lead, Tin  
AND  
PRECIOUS STONES**

*Titles given Direct from the Crown, Royalties, and Rentals Moderate*

Copies of the Mining Law and any information can be had on application to

**The Hon. Christopher Chisholm**

Commissioner Public Works and Mines, - - HALIFAX, NOVA SCOTIA

For Calendar and other information apply to the Secretary

A. T. LAING.

**An Accurate Ore Test**  
on any metal in 10 minutes  
For Five Cents.

That's what the Mining Man or Prospector can have, provided he has a Way's Pocket Smelter Outfit. Anybody can make his own tests right in his office or in the field on **any ore**. Think of what this means to a prospector "miles away from nowhere" or to the mining man who must make dozens of tests a day.

Write for folder giving full information about **Way's Process** and describing both field and laboratory outfits.

**WAYS' POCKET SMELTER CO.**  
Box 954, South Pasadena, Cal.

# Mining Companies

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing, and distributing Annual Statements, Special Reports, Descriptive Pamphlets, Prospectuses, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction. We are making a specialty of engraving and printing bonds, stock certificates, professional and business stationery, business cards and all such work. Orders from mining districts will receive prompt attention.

We shall be glad to furnish estimates to enquirers.

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver; \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals; or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,039 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

Or **WM. FLEET ROBERTSON**, Provincial Mineralogist, VICTORIA, B.C.

When answering Advertisements please mention THE CANADIAN MINING JOURNAL.

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
 Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

**Our Analyses Speak for Themselves.**

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

General Passenger Department, Intercolonial Railway  
MONCTON, N.B.

# Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

# HAMILTON POWDER COMPANY

Head Office: 4 Hospital Street, Montreal

MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and Sporting Powder, etc.

Safety Fuse, Electrical Fuses, Batteries, and other Accessories.

### NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

### "WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

### "AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

### PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

COBALT TORONTO KENORA WINNIPEG, MAN.  
VICTORIA, B.C. VANCOUVER, B.C. CALGARY. ALTA. NELSON, B.C.

Three Post Magneto Electric Blasting Machine

When answering Advertisements please mention THE CANADIAN MINING JOURNAL.

## The "Little Hardy" Coal Cutter

Holes at Floor Level or Roof Level or in any intermediate position in Coal or Dirt Band, &c.

Equally suitable for Holing and Shearing.

The Lightest Coal Cutter in the Market.

Nearly 700 Machines at work. 93 in use by one Canadian Company.

## The Hardy Simplex Hammer Drill

Weight 22 lbs. Bores 6 ft. Deep.

Automatically Rotates the Drill Steel and lows out the Cuttings  
FOR SINKING, &c.

# Behrend Concentration System

## Combination WET and DRY

A complete recovery from all slimes and minerals such as Graphite, Galena, Stibnite, Chalcopyrite, Tetrahedrite, Sylvanite, Molybdenite, Stephanite, Argentite, Ruby Silver and Native Silver.

This system will make low grade deposits pay. Every mine having an eye to business should investigate this system which has the approval of leading mining authorities.

A completely equipped plant, including concentrators, crushers, rolls, etc., for testing purposes is located at address below. Forward a sample of your ore for preliminary test.

## Behrend Concentrators, Limited

## Carbons

(Black Diamonds) for Diamond Drills

 Largest carbon ever found. 1/4 actual size.

NOTE. We personally break (in this country) our carbons, thereby enabling us to determine accurately their quality. We deal only in very best quality and are always ready to ship goods on approval and for selection to responsible parties. Write us.

## A Lesson in Economy

There are Rock Drills on the market to-day that at first appear a little lower in price than our machines, but when the matter of efficiency, durability and economy is taken into consideration, they cost, in the long run, from 25 to 35% more. We are prepared to back up our contention in this respect by actual facts. A thorough trial will convince you of the merit and economy of our tools. Write us for catalogue No. 27 descriptive of our many different devices for the development of mining claims.

## The Canadian Mining Journal

With which is incorporated the  
"CANADIAN MINING REVIEW"

Devoted to Mining, Metallurgy and Allied Industries in Canada

Published fortnightly by the

**MINES PUBLISHING CO., LIMITED**

Head Office . . . Confederation Life Building, Toronto.  
Branch Offices Montreal, Halifax, Victoria, and London, Eng.

Editor:  
J. C. MURRAY, B.A., B.Sc.

**SUBSCRIPTIONS**—Payable in advance, \$2.00 a year of 24 numbers, including postage in Canada. In all other countries, including postage, \$3.00 a year.

Advertising copy should reach the Toronto Office by the 8th, for the issues of the 15th of each month, and by the 23rd for the issues of the first of the following month. If proof is required, the copy should be sent so that the accepted proof will reach the Toronto Office by the above dates.

### CIRCULATION.

During the year ending with March 1st, 1908, 91,750 copies of "The Canadian Mining Journal" were printed and distributed, an average of 3,822 per issue.

"Entered as second-class matter April 23rd, 1908, at the post-office at Buffalo, N.Y., under the Act of Congress of March 3, 1879."

## MINING ENGINEERS AND MINING INSTITUTES.

Mr. J. D. Kendall, in a forceful article printed in this number of The Canadian Mining Journal, asks an exceedingly pertinent question. "Why," enquires Mr. Kendall, "should men who know their business, and are prepared to do it honestly, allow a large part of it to be taken from them by imposters who . . . are always ready to barter a favourable opinion for an approved monetary consideration, and who in doing so bring disgrace upon a profession which, when properly practised, is in the highest degree honourable? . . . The rooting out of imposters must, at all times, make for the benefit of a mining country generally."

The rooting out of imposters is left, in Canada, to the individual or to circumstances. Public sentiment is lax. Professional sentiment is uncrystallized. Hence Canada is a favorite hunting-ground for the fake mining expert.

Mr. Kendall recommends that every person practising as a mining engineer should be compelled, by law, to become a member of an institute to which admission shall be gained only by examination. Those eminent in the profession might safely be exempted from examination. But, in all ordinary cases, the requirements for admission should be as rigid and as exacting as possible. Persons practising before admission to the institute should be liable to a heavy penalty.

With the spirit of Mr. Kendall's proposal we are in hearty accord. The problem of elevating and regulating the profession of mining engineering in Canada is urgent. We are not sure, however, that we can go as far as Mr. Kendall indicates. Our Canadian Mining Institute is in process of change. Full membership is no longer attainable by the layman. But the present membership is miscellaneous. Hence, although the institute can concern itself effectively in many public questions, it must avoid the dangerous ground of professional qualifications.

A solution, however, has been suggested. Restrictions as to admission cannot be made retroactive. They apply only to the present and the future. But segregation can be effected within the institute, by the creation of a special professional section. This, properly managed, should be robbed of all invidiousness. It will not discount ordinary membership, but will place a definite meaning on special membership. And ordinary membership should be always a preliminary stage.

In this special membership should be included only those who can qualify under some such scheme as that outlined by Mr. Kendall.

We cannot refrain from citing here an instance that was brought to our notice not long ago. A young man, who can claim membership in several institutes, was engaged to write a report upon a cobalt-nickel property. That report was the most complete demonstration of ignorance and ineptitude that we have ever seen. We believe that it was written in all honesty; it is impossible to think otherwise. But as an exhibit of crassness, carelessness, and unfitness this precious document was the limit. This is precisely the kind of malpractice that is most disastrous to the profession. The fakir can be explained; the unfitness of the respectable practitioner cannot.

### A PERENNIAL PARADOX.

Attention has been drawn frequently to certain anomalies that exist in the methods of valuing the mineral products of Canadian mines and smelters. An outstanding example of discrepant methods is afforded by a comparison of the returns for Ontario nickel, as given respectively by the Ontario Bureau of Mines and by the Dominion Mines Branch. This discrepancy is noted annually in the Report of the Bureau of Mines; but, so far, there has been no attempt to reach a common basis.

As explained in the Bureau's Report, the Dominion statistics are based upon the average price of refined nickel in New York, while the Bureau's figures represent the value of the nickel in the form of matte at the point of production, "as given by the producers." The last phrase is significant.

The net result is that the Bureau's returns are little more than 20 per cent. of those of the Dominion. For 1908 the Bureau reports the value of nickel produced in the province as \$1,866,059; while the Dominion Mines Branch sets the value as \$8,224,180—a difference of \$6,358,121.

We have no reason to think that the former evaluation, \$1,866,059, is excessive. It takes account only of the nickel as matte, at point of production, and sets a value of about 9 cents per pound of nickel. On the other hand the Mines Branch calculates the nickel at 43 cents per pound. In other words, nickel ore mined and smelted in Canada gives a product worth approximately one-fifth of the price obtainable after the matte has been refined on the other side of the border.

The industrial magic, whereby the metallurgical product is enhanced five times in selling price by means of operations incomparably less costly than mining and smelting, arouses our interest. It is obvious, of course, that a restricted market may have much to do with fixing the price of refined nickel. But that difference of more than six million dollars can hardly be referred to market exigencies.

Certain international aspects of the nickel industry we are tempted to touch upon. But we shall refrain.

It will be sufficient to suggest that we would like to hear a just reason why part, at least, of the nickel produced in Canada cannot be refined here. Several Ontario manufacturing centres would welcome the opportunity of helping to produce that odd six million dollars.

### KENORA MINING NEWS.

Our Kenora correspondent, on another page, gives an interesting account of his impressions concerning the decline of gold mining in that once flourishing country. The usual causes, incompetent management and unlimited gold stealing, are believed to have been at the bottom of Kenora's failure. There appears to be ample evidence to warrant the statement that gold stealing assumed shockingly large proportions.

It is difficult for one who has no experience in gold or silver mining camps to credit the stories that are told.

But the history of rich camps is everywhere the same. Enormous quantities of Yukon gold were stolen under the very eyes of employers. Lurid tales, many of them amply substantiated, came from Goldfields, Tonopah, and Rawhide. Systematic and extensive high grading is practised in certain Australian camps. In South Africa, the misappropriation of amalgam and bullion is by no means uncommon. Hence it is not unreasonable to assume that there is a foundation in fact for the Kenora stories. As in Nova Scotia, where "high-grading" prevailed to an astonishing extent not long ago, the ores of the Kenora mining division contain frequent patches of beautiful specimens of native gold. Native gold makes a notably direct appeal to the wage-earner.

Undoubtedly gold stealing has been a serious drawback to the Kenora mines. But competent supervision should, and can, reduce to a minimum the possibilities of this illicit habit.

It would be an instructive experiment to place one of the old mines of the district in qualified hands and watch the results. An Ontario gold mine, run on its own merits, would be something of a novelty.

### PARLIAMENTARIANS AND FACTS.

It is unfortunate that the mineral industry has no representation in the Dominion House of Commons. Recently a Liberal member, Mr. Ralph Smith, in the course of a speech advocating the cause of technical education, made a wild reference to the number of fatalities in Canadian coal mines. Although Mr. Smith's statements were partly corrected by the Hon. W. L. Mackenzie King, they are calculated to leave a totally wrong impression upon his hearers.

Mr. Smith asserted that the rate of fatalities in Canadian mines is greater than in any other civilized country. This is incorrect. Nova Scotia coal mines,

owing largely to enlightened managerial policy, show the lowest death rate per million tons mined. British Columbia's rate has been excessive, but will be reduced when the use of safety-lamps is made compulsory. Alberta, where statistics are very loosely gathered, makes a fair showing.

The metalliferous mines of Canada are not adequately inspected. But, so far as can be determined, the death rate per thousand men employed, is lower than the rate obtaining in many districts in the United States. As regards the newer camps of British Columbia, Ontario, and Nova Scotia, where large numbers of small prospects are being worked, it is manifestly unfair to make comparisons. In well-organized and established mining centres the rate of fatalities will always be lower than in new districts.

Mr. Smith might well have urged that the Federal Mines Branch take up, as a regular duty, the prevention of mine accidents, the Dominion Government has been entirely apathetic in this respect.

#### OTISSE.

The suit brought by E. Kenyon-Stowe to set aside the sale of the Otisse mine to the Otisse Mining Company was thrown out by Justice Latchford on November 24th. Costs are to be paid by the plaintiff.

During the progress of the suit the Otisse mine has been steadily developed, since the owners were fortunately able to finance operations. Hence the obvious purpose of the plaintiff was defeated. He succeeded, however, in harassing and hampering the Otisse Mining Company for considerably more than a year.

The fact that irresponsible persons are permitted to institute mischievous litigation of this kind is a reflection upon our judicial system. The result of this suit discredited Mr. Kenyon-Stowe completely. This, however, is little consolation to those who have suffered from a protracted and groundless lawsuit.

#### EDITORIAL NOTES.

To our editorial comment upon Mr. Kendall's article we may add here our opinion that every mining engineer who joins the Canadian Mining Institute should give to the secretary a full record of his professional career. Further, it would be well to complete this record by annual additions. This would be one construction step in the "rooting-out" process to which Mr. Kendall refers.

An article that will reveal some startling figures as to actual cost of producing compressed air will shortly appear in The Canadian Mining Journal. It will be accompanied by a series of diagrams that represent actual tests made under working conditions in a leading Canadian mining camp. The name of the camp and

the identity of the mines where the tests were made are suppressed—for reasons that will be obvious.

Our two review numbers, January 1st and January 15th, will be worthy of attention. All the larger mining fields will be suitably dealt with and many new possibilities pointed out.

The closing year has been one of unprecedented activity. The number of foreign investments has rarely been exceeded. German, French and United States capital has come into Canada freely. English investors manifest less aloofness than heretofore.

The strike that is tying up Australian coal mines is having its effect on Canada. Enquiries for coal have reached Vancouver. It is probable, in the event of the strike continuing indefinitely, that orders will be filled at British Columbia collieries.

#### REPORT ON THE IRON ORE DEPOSITS ALONG THE OTTAWA AND GATINEAU RIVERS.

By Fritz Cirkel, M.E.

The iron ores of the valleys of the Ottawa and Gatineau Rivers have been the subject of an investigation by Mr. Fritz Cirkel, M.E., for the Mines Branch of the Department of Mines, and his report has just been published.

The publication of this report comes at a very opportune time, owing to the development lately assumed by the smelting of iron ores by electricity; for the region in question possesses great water powers, a part of which could aptly be applied to the establishment of an iron and steel industry.

After describing in detail various iron ore deposits in the townships of Hull, Templeton, Wakefield, Bristol, Grenville and others, Mr. Cirkel concludes that many of these would yield ores which could in all probability be treated profitably in the electric furnace. It is stated in the report that this method of reducing the iron ores can compete with the blast furnace for the production of pig iron, when electrical energy can be developed at a low cost.

All engineers and metallurgists interested in the iron and steel industry will read the report with interest, more especially the general conclusions, which are given from page 100 to page 107.

An appendix to the report gives a synopsis of the water powers, both developed and undeveloped, in the region under consideration. These data have been compiled from the latest authoritative sources available. The following falls can all be developed to produce large quantities of power: Pagan Falls, Cascades, Chelsea Rapids, Great Falls, Coulange River, Roche Fendue, Calumet Falls, Chats Falls.

The report is well illustrated by five plates, fifteen drawings, and two maps, and the whole forms a volume of 147 pages, which constitutes a valuable addition to the series of bulletins on the mineral resources of Canada issued, under the direction of Dr. Eugene Haanel, by the Mines Branch of the Department of Mines.

# MINING ENGINEERS AND MINING INSTITUTES

Advance copy of paper to be read before the Canadian Mining Institute.

By J. D. Kendall.

On more than one occasion I have tried to induce engineers to discuss this subject with the view to arriving at some general understanding and resolution as to the means necessary to place mining engineers in a position before the law, similar to that occupied by members of other professions.

Spencer has truly said "It is only by varied iteration that alien conceptions can be forced on reluctant minds". I therefore, return to the subject once more, knowing, however, that the conceptions are alien to some only, although the reluctance to deal with them seems to be almost general. Why it should be so I cannot understand. Why should men who know their business and are prepared to do it honestly allow a large part of it to be taken from them by imposters who, gathering in all new mining districts and sometimes old ones, are always ready to barter a favourable opinion for an approved monetary consideration, and who, in doing so, bring disgrace upon a profession which, when properly practised, is in the highest degree honourable? This, of course, I know is only an egoistic view, but from the altruistic standpoint the prospect is equally satisfactory. The rooting out of imposters must, at all times, make for the benefit of a mining country generally. To the persons who employ these imposters there would, doubtless, be a serious loss, or rather the sources of their illegitimate revenues would disappear, but that would be a matter for congratulation rather than regret.

The question then arises, how are these imposters to be weeded out. In my opinion it can only be done in one way. In every mining country an institute should be established by Parliamentary enactment, and every person practising as a mining engineer in any country should, after the expiration of his privilege, be compelled, under serious penalties, to become a member of the institute of that country, and gain admission to it by examination only, except in the case of men eminent in their profession in whose favour, for the first six months or so after the establishment of an institute the Examining Boards might dispense with the usual conditions of entry. Every candidate for admission should have to produce to the examiners at least two written testimonials as to character from persons who have known him intimately for at least four years. After the first six months of an institute's existence these testimonials should be from members of the institute. Any person practising before admission to the institute should be liable to a serious penalty enforceable by law.

Membership by the institute should be graded according to experience, and other qualifications, and the different grades should be indicated in such a manner that the public cannot possibly be misled as they are at present. I recollect the case of a man who some years ago in recommending a very wild cat to the public, wrote the initials "E.M." after his name. Later he was obliged to appear in a law court to support his recommendation, and was there asked if he was an Engineer of Mines. He said, "No, the letters in my case simply mean Expert Miner." A similar mis-

leading use of the initials employed by a statutory-formed institute to indicate membership should be made punishable by law.

The requirements of the Examining Board should be ethical as well as intellectual. I am convinced that our whole system of education is wanting in this connection. The ethical side of a man's mind is not cultivated to anything like the extent it should be. A knowledge of right conduct no more grows with us than a knowledge of right geology. Besides the general rules of conduct, which ought to be taught with the three R's, there are rules of special application to the different walks of life. Some of these, so far as they effect the mining engineer, were referred to in a previous communication. They should be made rules of the suggested institute, and their infraction should be made punishable by removal from its rolls. They should, moreover, form part of an engineer's education, and not be left for him to find out in later years after he has unwittingly done some of the mischief to which their non-observance will surely lead. Engineers are frequently offered contingent fees which, I need hardly say, should always be refused unless the contingency be legitimate profit to their employers. Young engineers are often greatly puzzled to know what to do under the circumstances, such matters never having been dealt with in their training, as they ought to have been. I remember a case in which a well known person went into a young engineer's office for the purpose of obtaining a report on a property he intended placing before a company of which he was a director. He said, "I am not sure that I can sell the property, so I want to make an arrangement with you something like this: If I don't sell the property I shall give you fifty dollars for your report; if I do sell it I shall give you fifteen hundred dollars". The young engineer very properly declined this offer, saying, "My charge will be two hundred and fifty dollars whether you sell or not". Think of the inducement there is in such an offer to produce a favourable report, and the necessity of pointing out to students the true inwardness of such offers must be at once conceded.

I have purposely refrained from loading this communication with the many illustrations which might be adduced to show the necessity for the suggested changes, because there must occur to the mind of every engineer of experience many such illustrations. Can anything conclusive be urged against the proposed changes? If not, I hope this institute will take the lead in what I, and others with whom I have spoken, consider to be a much needed reform, and establish itself on the lines indicated, or some similar lines which will give its members and the mining public that protection from the operating of the "Yellow-legger", and the unprincipled promoting they so much need. Much can be done by such an institute in the way of exposing, and thereby putting a stop to, the crooked methods of the latter, that individuals, however courageous, could not afford to do.

It is not for a moment thought that any or all of the suggested changes would place engineers on one plane

of efficiency. Differences must always exist so long as variation and environments are factors in organic evolution. But with the suggested reforms we should have engineers and engineers. Now we have engineers and fakirs.

The institute advocated, which might be called the National Institute, need not in any way interfere with the local or Provincial Institutes which are so

necessary for the reading and discussion of papers, but if the publication of the papers were undertaken by the National Institute, the reduced cost would, to some extent, if not entirely, effect the diminished revenue, for the number of members would certainly be reduced under the proposed scheme. But I think engineers would readily agree to an increased subscription in consideration of the protection they would obtain and their improved position generally.

## THE NORTH THOMPSON VALLEY, B.C.

By J. C. Gwillim. \*

The recent election campaign in British Columbia has brought to the front a railway route that will pass through a little-known district, but a district that at one time promised to be on the main line of the C.P.R.

This is the valley of the North Thompson River, which cuts diagonally from near the great depression west of the Rocky Mountains proper at Tete Jaune Cache into the heart of the great central plateau at Kamloops. Thus it avoids crossing the Selkirk ranges met on the main line of the C.P.R. and Crow's Nest railway.

The Grand Trunk Pacific, issuing from the Yellowhead Pass of the Rocky Mountains proper into the same great valley as the proposed C.N.R., will follow another diagonal valley, the valley of the Fraser, and so reach the central district of Fort George without crossing the usual summits of the ranges west of the Rocky Mountains proper.

Both railways expect to reach the Pacific coast with a maximum grade of four-tenths of one per cent. by using the low pass at Yellowhead and, one going south-west while the other goes north-west, reach the ports of Vancouver and Prince Rupert respectively.

The proposed C.N.R., after emerging from the Rocky Mountains at Tete Jaune Cache, will pass down the great open valley southwards to Canoe River 16 miles, thence over the low pass to Albreda River, down this river to its junction with the North Thompson, 48 miles, thence along the narrow valley of the North Thompson, through the "wet belt" of cedar, hemlock and devil's elms, into the dry, more open country of the interior plateau 100 miles north of Kamloops; thence, still following this more open valley, to its junction at Kamloops, a total of 240 miles from Tete Jaune Cache.

Yellowhead Pass at one end of this district and Kamloops, or old Fort Thompson, at the other end, each has a history dating back to the fur-trading days early in the last century. For David Thompson, the explorer and trader, according to Mr. J. B. Tyrrell's "Life of David Thompson," passed through Yellowhead Pass on his way from the plains to the newly-established ports on the Kootenay and Columbia in 1810, while Fort Kamloops, according to Father Morice's "History of the Northern Interior of British Columbia," existed prior to 1821 and was on the route for supplies from the lower Columbia to the posts on the upper Fraser River.

But the great narrow valley of the North Thompson

\*Professor of Mining, School of Mining, Kingston, Ont.

between them was a solitude, first travelled and described by Milton and Cheadle in their memorable journey of 1863, and a few years later by Dr. Selwyn, the C.P.R. surveyors, and the late Principal Grant.

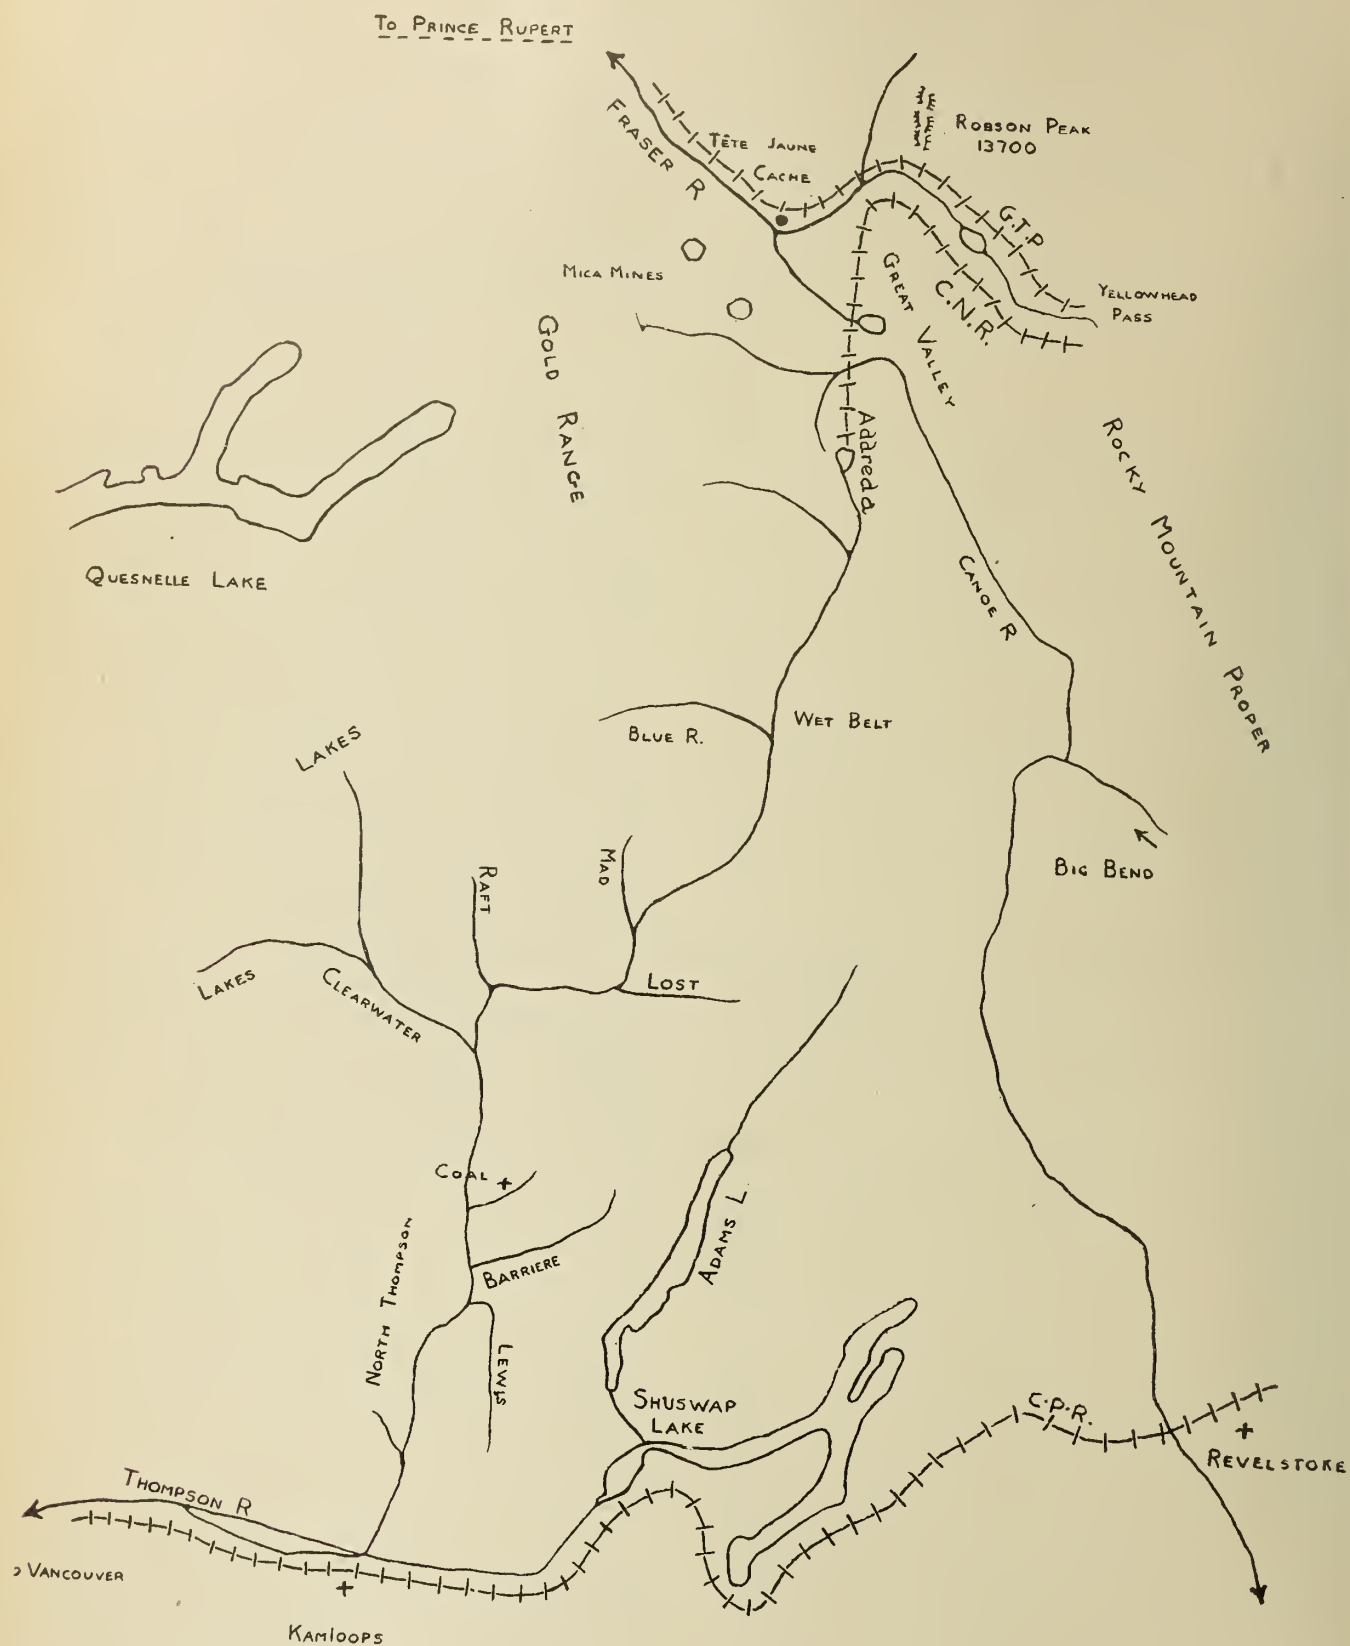

This account gives little information beyond references to various local features of the topography and the obstructive character of the vegetation, such as the presence of the "devil's elms" or "aralea and the gloomy forest," as Dr. Selwyn described it when he traversed it eight years later in the opposite direction.

In 1871, Dr. Selwyn, then Director of the Canadian Geological Survey, made an expedition from Kamloops to Tete Jaune Cache and "Leather Pass"—a trip which took him nearly two months. Finding the main valley of the North Thompson too toilsome, at a point 105 miles above Kamloops, he ascended the plateau country to the west of it, returning to the main river at a point 45 miles further on. Thence he followed the Thompson and Albreda to the great valley at the Cache. At this time, 1871, the C.P.R. was active in exploring various routes between the Fraser River and the plains. For several years they pushed forward this location along the North Thompson until it was abandoned for the present route of the main line through the Selkirks, located by Major Rogers. However, the surveyors left a good trail with bridges and camping places, at one of which, Canoe Landing, is recorded on a board:—"F. A. Hassaek and John Dillon, Camp 1871, C.P.R.S."

This trail is now overgrown with brush, and most of the bridge work is gone, yet it is still passable for the few who come that way. Otherwise the valley, beyond the few scattered ranches, has lapsed into solitude, until now, after nearly thirty years, a second generation of railway locators invade it.

During the interval a number of expeditions have been made from Kamloops to the mica mines of Canoe River and Mica Mountain, a few miles south-west, and west of Tete Jaune Cache, a journey of about 15 days by pack train.

As early as 1852, Bancroft, in his history of British Columbia, records a report of placer gold being found on the Thompson, and in 1857, Chief Trader McLean, of Fort Kamloops, sent to Fort Victoria for iron spoons to scrape the gold from the bed rock crevices. It was in 1858 that California miners first worked the bars of the lower Fraser River leading up to the discovery of Old Cariboo, which resulted in the sad hardships of some gold-seeking emigrants, who, in 1862, attempted to reach them overland by way of Yellowhead Pass and the upper North Thompson.

SKETCH MAP OF NORTH THOMPSON RIVER

SCALE IN MILES 0 10 20 30 40

Principal Grant, passing through Yellowhead Pass with Sir Sanford Fleming, then Chief of Location for the C.P.R., attributes the name of this pass to an old Iroquois hunter who cached his furs at the great valley of Tete Jaune Cache until he was ready to pack them over the Pass to Jasper House on the Athabasca. His hair being of a light colour gave the place its name. Another story is that it was named after a yellow-haired packer of the Hudson Bay Company who made this place a depot on his way from Fort George on the Fraser to Henry House on the Athabasca. Be that as it may, there is, or was, one lonely family group of Indians permanently encamped at this place who might well be descendants of the original Iroquois "Tete Jaune," save the yellow hair, which is not possessed by "Old Moy-ees" or any of his family.

The earliest account of a traverse from the "Cache" to Kamloops seems to be that very bright chronicle of the Milton and Cheadle expedition, "The North-west Passage by Land," made in 1863. These valiant travellers had a most troublous time and would likely have perished but for the resource of Mr. and Mrs. Assiniboine, Stoney Indians, who accompanied them.

For 100 miles up the climate is fairly dry, the valley lightly wooded, and dotted with open spaces and bunch grass. A few isolated ranches and some fair-sized patches of fertile land exist along this distance, after which the wet belt is reached. Thence with few exceptions the valley is narrow, rocky, and heavily timbered with hemlock, cedar, and other vegetation

of a wet country, until the great open valley near the Cache is reached. At this point the rain- and snow-fall is light, and a heavy growth of grass is observed. This is a place that for many years has been considered good wintering ground for horses, where there is a larger tract of land fit for agriculture than elsewhere on the route.

Concerning the timber resources, there is much heavy cedar in places, and there may be extensive areas on some of the tributary streams; but riding along in the narrow, gloomy valley one does not see far afield.

The most extensive meadows or valley lands are at the Indian Reserve, 50 miles north of Kamloops; Stillwater Flats, 125 miles; and Blue River Meadows, 155 miles up the river. Otherwise there are a few small areas and benches; but for much of the way the valley is, as Dr. Selwyn says, remarkably deep-cut and narrow for so large a stream.

At the Indian Reserve, on Coal Creek, 50 miles from Kamloops, there is a small area of coal strata, similar to the Nicola in age and quality of the coal. The seams exposed are thin. A section given by Mr. McEvoy, in 1894, is:—

|                         |                          |
|-------------------------|--------------------------|
| Coal—6 inches.....      | Hygroscopic water, 2.22% |
| Sandstone—2 feet.....   | Volatile Comb. 32.05%    |
| Coal—9 inches.....      | Fixed Carbon, 52.81%     |
| Sandstone—6 inches..... | Ash, 12.02%              |
| Coal—18 inches.....     |                          |

Some of this coal has been taken on scows or boats to Kamloops, and is well spoken of.

(To be continued.)

## CANADIAN AND ENGLISH COMPANY LAW.

(A continuation of the discussion that appeared in our issue of November 15.)

A letter of an English correspondent of The Financial Times, of London, England, that was published by our contemporary on September 1st, was reprinted in the Canadian Mining Journal of November 15, along with a reply from Mr. J. J. Harpell. The Times' correspondent asserted that there exists in Canada no such legislative control of company promotion as is maintained in England. Mr. Harpell, replying to this, pointed out that the Ontario Companies Act is much more rigidly enforced, especially as regards mining companies, than is the English law.

In The Financial Times of October 29th the anonymous correspondent takes exception to certain of Mr. Harpell's statements, and asks some leading questions. These questions Mr. Harpell answers completely in the letter reproduced here.

We are compelled to remark that The Financial Times' correspondent displays not even a casual acquaintance with Canadian company law. He has arrived at his conclusions without taking the trouble to glance over even the Ontario Act on which he has so much to say. Moreover, his knowledge of the English law is certainly superficial and inaccurate.

We do not choose to pose as apologists of Canadian business morals, beyond remarking that the worst Canadian examples of business turpitude flourish better in foreign lands than on their native soil. Canadian company laws are patently defective in some respects.

But, despite all talk of Somerset House, we believe that our legislative machinery does not suffer unduly by fair comparison with that of the Mother Country. Fair comparisons, however, cannot be expected from a writer who rushes into print totally misinformed or uninformed, or both.

This particular kind of Pharisaism we cannot and need not tolerate. Grave abuses exist in Canada, as in every prosperous and exploitable country. The man who is brave enough to point these out, whether he be a Canadian, an Englishman, or a Turk, we respect. But the destructive critic must, above all things, make sure that he is well and truly informed. Slipshod, acidulous, and vain generalities do nothing but harm. They cannot remedy abuses, because they are aimed at wrongs that do not exist.

But the reader may judge for himself:—

From The Financial Times, October 25th.

### CANADIAN COMPANY LAW—HOW IT DIFFERS FROM ENGLISH LEGISLATION—REPLY TO CRITICISM.

(From a Correspondent.)

On 1st September The Financial Times published an article by the writer dealing with the over-capitalization of Canadian companies and defects in the Dominion and Provincial Companies Acts. The article was

written for the purpose of giving information to British people who are investing largely in shares of companies of Canadian origin and administration and sounded a note of warning, such as it is the peculiar province of a paper like the Financial Times to give to its readers. Naturally the article has provoked much resentment in many interested quarters and has evoked considerable hostile newspaper comment, as was to be expected. Editorially, a London financial paper remarked that "in the case of a young and growing country it is inevitable that much latitude should be allowed to individual enterprise." This is undoubtedly true, but that such latitude should extend to the Directors and promoters of Canadian companies in dealing with other people's money is a matter on which British investors in these companies are entitled to hold strong opinions. As was pointed out in the former article, Canadian Directors have not come to realize, as a class, that they are trustees for the shareholders in a company, as well as for the "controlling interest" in any company. When the law confers the privileges of incorporation and limited liability upon a company in England it, so to speak, constitutes the new entity its ward and carefully supervises the proceedings of its trustees, the directors.

### The British Investors' Standpoint.

Such is not the case in Canada, where the controlling interest is supreme and the controlling interest is usually in the hands of the promoters. It may be urged with considerable truth that the promoters of an enterprise are usually the persons most capable of managing it successfully. On the other hand, it is the fact that there are Canadian companies in which British investors are interested where the interests of the promoters—that is, the controlling interest, otherwise the Board of Directors—are not in harmony with the interests of the minority shareholders, British or Canadian. Take the case of a large corporation that forms several subsidiary companies, the shareholders in each of these being different, but the "controlling interest" the same. The smaller companies will probably be managed entirely in the interest of the larger concern, regardless of the shareholders in the smaller company. The idea in general in Canada that if a British investor gets anywhere from 3½ to 5 or 6 per cent. for his money he ought to be entirely satisfied and ask no questions. But what of the large profits made by the Canadian promoters who have contributed little or no money towards the cost of such enterprises? The state of the Canadian company laws permits these undisclosed profits to be concealed beyond the hope of finding out by any shareholder. Of recent years the whole force of English company law has been directed towards compelling the most complete disclosure of contracts, antecedent to the formation of a company, which might in any way influence an investor in taking or refusing to take shares in such company, and such contracts are on file, so that "he who runs may read." Such is not the case in the Dominion of Canada. However, nearly all the shares in Canadian companies that are sold in England pass by transfer and not by original allotment, consequently the transferee takes them with the same knowledge as the transferor had. Of course he has not actually got this "knowledge," but in accepting the transfer he is assumed to have it, which amounts to the same thing.

### Cobalt Flotations.

In The Financial Times of Saturday last there was a letter from Mr. J. J. Harpell complaining that the writer of the article of 1st September had "done much injustice to Canadian people and to many of their laws and institutions." Mr. Harpell then goes on to state that "it would be a great mistake to leave your readers under the impression that Canadian company law has not been modelled after similar English legislation, because nothing could be further from the truth." On the other hand is the deliverance of your financial contemporary, already referred to, who in criticising the aforesaid article gave the valuable opinion that the Canadians, being wise in their generation, had adopted in their legislation the best points in both English and American company law. As there are now nearly fifty States in the American Union, and each has its own special company laws, the framers of Canadian legislation must have had a wide fund of information to draw upon. Had space permitted, allusion would have been made in the former article to the attempt made by the Ontario Government and Parliament to reform the company law of that province. This was brought about by the absolutely scandalous state of affairs in Toronto in the way of company promotion at the time of the Kootenay boom in the closing years of the last century. It is to be feared that a not much better state of things exists at present when one reads in the Toronto papers that Cobalt claims—"claims," and not "mines," is written advisedly—were incorporated as public companies in one week for an aggregate sum of no less than \$16,000,000. The smallest of these capitalizations the promoters, with modest assurance, placed at \$1,000,000.

### Differences in Canadian and English Law.

Mr. Harpell says that "The Companies Act of Ontario is almost an exact replica of the English Act of 1901, with one or two very important amendments." Will Mr. Harpell state that the Ontario Act prohibits the issuance of shares at a discount or the giving of shares to directors to qualify them? Does it prescribe a minimum subscription upon which a company can go to allotment? Mr. Harpell says that all the information available about English companies at Somerset House can be found in a similar way at the Provincial Secretary's office in Toronto in regard to companies incorporated in Ontario. Not very long ago the writer had occasion to make a search at the Ontario Provincial Secretary's office in regard to an important company incorporated in the province and doing business outside the Dominion, and all the information he could get "didn't amount to shucks"—nothing like the returns that are compulsorily filed at Somerset House. In the search made by the writer the main object was to peruse any contracts or agreements made antecedent to the incorporation of the company in question. Nothing of the kind was to be found, though there were some details showing the date of incorporation, names of the incorporators and details of capitalization, all of which had already been obtained from the files of a Toronto newspaper. Mr. Harpell is, no doubt, familiar with the letter of the Ontario company law, and the writer is not, but he has had considerable experience of its operation. He has also some experience of the Dominion Acts and special Charters, as well as those of several of the provinces, and has no hesitation in repeating the warning given to British investors in the article of 1st Sep-

tember that before buying into Canadian companies they should ascertain (if they can) whose shares they are buying, what cash has been paid into the treasury of the company from sales of shares, and for what consideration, if any, the shares were originally issued.

### Evil of Over-Capitalization.

Mr. Harpell, in the second half of his letter, after commending your correspondent for his criticism of the over-capitalization of the Canadian electric power companies, goes on to say: "Almost every conceivable commodity in Canada is being syndicated and capitalized to an extent that is forcing up the cost of living and production to a point where the prosperity and development of the country are being threatened." In this he is quite correct, and the cause is to be found in the laxity with which the various Companies Acts are framed and administered. If adequate disclosure of every company's affairs were compulsory, and a sufficient ad valorem tax placed upon all share capital issued for anything except cash at full par value, or its legitimate equivalent, the monstrous over-capitalization that has been going on would cease. The writer has been accused of dealing in "vague generalities," but it would be easy to cite particular cases. They are well within the knowledge of every Canadian, but it would be invidious to name one or two where many Canadian companies are in the same boat, and when their operations are perfectly legal and meet with the approval of the commercial communities in which they are domiciled. This much may be said: These enormous over-capitalizations, if attempted here, would shock the commercial conscience of England and become impossible of accomplishment. That is why it was written in the former article that the commercial morality of Canada is patterned upon the United States rather than upon Great Britain. Mr. Harpell himself shows how Canada is following the lead of the "Land of Trusts" rather than in the footsteps of the Old Country, and to that extent exonerates the writer from making any imputation against the people of Canada, for whom he has a great regard and admiration. If, however, some of the leading Canadian business men conduct their operations on the lines of high finance in the United States, it is the duty of influential English papers to draw attention to the fact, for, after all, it is money subscribed by the British public that provides the cash basis upon which many Canadian companies have built up monstrous super-structures of share capital unrepresented by any asset save the commercial astuteness and assurance of the promoters and their associates.

### MR. HARPELL'S SECOND LETTER IN REPLY TO THE ABOVE.

To the Editor of, "The Financial Times" London, Eng.

Sir,—There are a few points raised by your correspondent in his communication that appeared in the Financial Times of Oct. 29th, which require answering. Further than replying to these I have no desire to prolong the discussion. It has been sufficiently demonstrated that if avaricious and reckless promoters choose to charter Limited Liability companies in Canada and sell their securities in England, no greater blame can be attached to the people of one country than to those of the other. This is particularly so when both countries have shown themselves equally desirous of curtailing and of stamping out this sort of thing

by the best legislation they can conceive. Furthermore, as I have pointed out in my former letter the losses sustained by the over-capitalization of these companies are not borne altogether by the investor. In so far as they have been able, these companies have compelled the Canadian consumer to pay a price for their products that would enable them to earn the dividends promised the English investor. For this reason, if for no other, the people of Canada are just as anxious to expose and punish the perpetrators of this kind of fraud as are the people of this country.

In the course of his article your correspondent writes as follows,—"Will Mr. Harpell state that the Ontario Act prohibits the issuance of shares at a discount or of giving shares to directors to qualify them? Does it prescribe a minimum subscription upon which a company can go to allotment?"

In answering these questions the writer has before him copies of both Acts. So far as he can discover the English Act makes no mention of issuing shares at a discount. It does not seem either to permit or to forbid it. On the other hand the Ontario Act permits it in the case of mining companies only. But in Section 141 the Ontario Act states that "No shares shall be issued at a discount unless authorized by a by-law of the company confirmed by a majority of the shareholders thereof——." A copy of this by-law must be filed in the office of the Provincial Secretary and on each of the share certificates of such a company the words "No Personal Liability" must be distinctly written.

As regards the giving of shares to directors to qualify them, both the English and Ontario Acts permit this. But both also require that the prospectus shall state full particulars of the nature and extent of the interest (if any) of every director in the promotion of or in the property proposed to be acquired by the company with a statement of all sums paid or agreed to be paid to him in cash or shares by any person either to induce him to become, or to qualify him as, a director. This is verbatim Sec. 99 Sub. Sec. 1 (m) of the Ontario Act as well as Sec. 10 Sub. Sec. 1 (n) of the English Act.

Again, neither the English nor the Ontario Act prescribes a minimum subscription upon which a company may go to allotment. But both are equally exacting in requiring that this be set forth in the articles of incorporation and that if it is not so stated the company cannot go to allotment until the whole capitalization is subscribed. Both Acts also require, in the following words, that the prospectus "must state the minimum subscription on which the directors may proceed to allotment" Sec. 10 Sub. Sec. 1 (d) of the English Act and Sec. 99 Sub. Sec. 1 (d) of the Ontario Act.

In a recent issue of "The Accountant" the following reference to this section of the English Act occurs:—"Although Sec. 10 Sub. Sec. 1 (d) of the Companies Act provides for a minimum subscription to be stated in the prospectus, there is no regulation as to the ratio it should bear to the nominal capital, and in a recent registration the minimum subscription was fixed at £100, while the potential capital reached £70,000. It may be very difficult to draw a hard and fast line in this matter, and the draftsman of the Act may have been under the impression that cases such as we have illustrated would carry their own condemnation by such a bare-faced evasion of the spirit of the measure; yet it is not easy to see wherein lies the benefit of the Sub. Sec. in the absence of any limit."

You will notice, sir, that neither in this nor in my former letter have I made any attempt to exonerate or defend the excessive flotation of private Canadian companies. My only desire in writing is to disassociate the Canadian people from the promoters of this sort of thing, and to point out that the Companies Act of the Province of Ontario which is modelled after your own English Act, is even more effective than the latter in protecting the public from fraudulent flotations. If the English Act required, as does that of Ontario, prospectuses and advertisements of foreign companies to disclose as many material facts as is required of the

prospectuses and advertisements of home companies there would not be so many offering their securities in this market, and much would be done to protect the English investor from the losses that he will undoubtedly suffer. It would be interesting and, no doubt, instructive to know to what extent the English Companies Act is responsible for the large foreign investments of English capital, as compared with the amount that is being invested in local securities.

I am etc.

J. J. Harpell

## PRACTICAL HINTS IN THE PRECIPITATION OF SILVER FROM CYANIDE SOLUTIONS

by R. B. Lamb\*

The precipitation on zinc shavings of silver from cyanide solution is a function of the richness of the solution. The success of the precipitation and recovery of the bullion depends largely on this very important factor. The richer the solution in silver, the more easily precipitation is effected, and the simpler the subsequent recovery operations become. It is therefore important in the manipulation of cyanide solutions, before passing through the zinc boxes, for the metallurgist to arrange the flow of his solutions in such a way that the values are concentrated in a given amount of solution, or at least, in a certain or certain solutions before passing through the zinc boxes. When this method is employed, precipitation gives little or no trouble and a higher grade zinc silver product is obtained. With very high grade solutions in many instances 75 per cent. or even 85 per cent. of metallic will be found in the zinc silver precipitate, and the precipitation will occur almost wholly in the top compartments of the box. The consumption of zinc is much less on high grade solutions, and the deposition of base metals and minerals does not take place to such an extent, particularly in the top compartments of the zinc box.

It is no longer the best practice to move the zinc of the bottom compartments to the head of the box in filling with new zinc. The zinc should be disturbed as little as possible, and sufficient new zinc put into the compartments, the corners and sides, being packed firmly, but not tight enough to cause channelling, and the new zinc being placed on top of the old. This should be attended to daily with as little disturbing of the zinc as possible. Every compartment should be gone over carefully and repacked daily.

Instead of moving the zinc from bottom to top, it is far better to depend upon the manipulation of the solutions, aiming to get a high grade solution that will give the successful precipitation desired by the metallurgist. At all times this method will give a higher grade of precipitate than will result from distributing of zinc from bottom to top.

The most important item in precipitation by zinc shavings is to have an ample zinc box capacity. Certain features of construction must also be carefully

attended to. The box should be constructed in such a manner that the flow of solution from the head to the tail of the box will be very sluggish and uniform. There should be no currents or channelling through the zinc. To obtain this result the width of each compartment should be not less than 18 inches. It should have a depth no greater than the length of a man's arm. The length of the box and the number of compartments will depend on the volume of solutions that have to be run through in a given time. The width of the box will depend on the individual taste of the operator. A single unit box should be of such width that a man on each side of the box can work comfortably and clean up. A double unit box must be constructed so that one man can clean up from one side. The space underneath the screen upon which the zinc shavings rest should be not less than four inches deep on one side, tapering to from 8 to 12 inches on the other side. The bottom of each compartment should be connected to the common launder by means of a plug or valve, preferably the former.

In present practice the zinc shavings should not be washed outside the box. To permit of this the compartments of the box should be of ample capacity, and should receive a small moveable trommel which is set up in the first compartment of the zinc box where the clean-up begins, and the washing should be done in the solution of the box itself. After all the compartments of the box have been washed in this manner by moving the trommel into each compartment successively, the washings carrying the silver zinc precipitate are run out through the launder to the clean-up tank. The compartments of the box are then thoroughly hosed out, the box filled with water, and the zinc returned.

It is unnecessary to describe the method of filling the box, as every metallurgist is acquainted with this procedure. The washing of the zinc boxes should be conducted once or twice, and with rich ore, possibly four times a month, and the resulting product should be collected in the clean-up tank. It is unnecessary also to describe the method of recovering the zinc silver slime from the clean-up tank. Either decantation or filtration may be used, the object of either method being merely to get rid of surplus water.

\*Mining Engineer, 42 Broadway, New York.

Although it may be used with advantage in many cases, it is not essential to use the acid method of refining, silver being too cheap a metal for this process. In some silver cyanide problems where the ore is particularly free from base metals, and the precipitation has been conducted by the metallurgist in a way that gives a high grade precipitate, it will be found that smelting with borax is the only refining operation necessary. The amount of borax used is for the operator on the plant to determine, but it should not run over 40 per cent.. It is quite unnecessary to dry the precipitate. In cases where a little base metal is present, it is sufficient, providing the solutions have been comparatively high grade, to melt the moist precipitate with borax, soda, sand, and 2 per cent. nitre. A tilting furnace of the Monarch type should be used; the precipitate should be charged into a nearly cold pot, and the melting should be pushed rapidly with a good hot fire to finish.

For refractory precipitates to prevent roasting and incidental loss, I give the following method, bearing in mind that silver precipitate at most plants will not stand roasting on account of silver losses, and the low price of the metals:—

Place moist precipitate in a large iron pan, and add water up to from 30 to 50 per cent. of the total weight. Add, as fluxes, borax, soda, and 2 per cent. nitre. The borax and soda should be kept to the minimum that will permit of good refining. Add a very small proportion of glass powder or fine sand; mix the fluxes with the precipitate in the pan, and shovel the mixture about well. It will be found that this product resembling in physical appearance a soft mud, can be melted without roasting. Moreover, fluxes are utilized to better advantage, the base metals are more easily got

rid of, and the pots will stand longer. Use a somewhat slow fire to start, rapidly increasing the heat to a hot and strong finish. After pouring, allow the charge to cool thoroughly before disturbing. Should the precipitate contain arsenic, antimony, or other base metals, or if lead acetate has been used in the treatment, there will probably be a matte or speiss, or a mixture of speiss and alloy of lead and antimony or other base metals formed on top of the bullion. If the button does not break off clean after a proper length of time for cooling there is a certain amount of alloy formed on top of the silver. The best way to deal with this is to remelt the bullion from the entire clean-up in a hot furnace and pass a current of warm air free from excess in moisture, through the molten bullion to oxide the base metal. Finish up with nitre refining flux. This flux should be made of borax, soda, and 5 per cent. nitre. It should not be added until the bullion has been formed, the slag removed, and the bullion remelted or the entire charge skimmed without pouring. By this method there will be practically no silver losses in refining, and the resulting bullion should not be less than 950 fine if the operation has been carried out by a careful manipulator. With a little patience it can be sent away from the plant 990 fine, or better, without adding to the cost of plant refining. I do not recommend roasting silver precipitates for the elimination of base metals, except possibly in a few exceptional instances. The method given above is the best that is known at present. It will be found on a little practice that the silver clean-up can be accomplished with a very small percentage of flux. The total percentage of flux on the method outlined should not exceed 50 per cent. the weight of the precipitate smelted for comparatively low grade precipitates, with corresponding less amounts for higher grades.

## REPORT ON THE WHITEHORSE COPPER BELT YUKON TERRITORY

By R. G. McConnell

Issued by the Geological Survey Branch, Department of Mines, Ottawa—Abstract Prepared for the  
Canadian Mining Journal.

(Continued from last issue.)

### Ore Bodies and Ores.

The outcroppings of the Arctic Chief ore body at the surface, consist of a long lens of nearly solid, practically unoxidized magnetite, stained in places with copper carbonates. The hard surface section is grooved and striated by ice. The oxidized upper portion, if any existed, was removed during the glacial period, and since then little alteration has taken place.

The ore body, as defined by the workings in the main level 65 feet below the surface, consists of a mass of magnetite, approximately 190 feet long, and from 25 to 40 feet in width. The mass is fairly regular in outline, but curves gently away from the granite contact, towards the west. Small parallel lenses have been disclosed by the workings at two points.

Little is known of the ore body below the main level. A centrally located shaft, 50 feet in depth, followed ore

for 25 feet, then passed through altered diorite. A short drift to the north, from the foot of the shaft, penetrated mixed ore and altered rock for a few feet, and then entered limestone. A lens of well mineralized magnetite was encountered in a short cross-cut from this drift to the right, following the lime-diorite contact; but the work done was insufficient to show whether this represents the downward continuation of the main ore body, or the upper part of a new lens. A cross-cut to the left, along the lime-diorite contact, led to the discovery of a vein of rich silver-bearing tetrahedrite. The vein varies in width from a few inches, to a couple of feet, and had been followed about 40 feet, at the time of my visit. It does not appear on the surface, and this mineral is not known elsewhere in the camp.

The main magnetite lens of the Arctic Chief is enclosed directly between altered granite and crystalline

limestone, at its eastern end only. The western portion of the lode bends away from the contact, and has developed entirely in limestone. Where the lode adjoins the granite, it is bordered by a zone of mixed ore, and diorite, largely replaced by secondary minerals. In the limestone it is more sharply defined, the dark magnetite usually ceasing abruptly against a wall of white limestone, either pure or containing only a few scattered grains of iron. Horseshoes of nearly pure iron occur in the magnetite, and tongues of magnetite occasionally penetrate the lime for a few feet.

The magnetite varies greatly in texture, often passing in a short distance from a fine close-grained condition to a coarsely granular one. In certain areas, especially near the boundaries, the grains are separated by a soft serpentinite mineral resulting from the hydration of secondary augite and actinolite. Clinoclase is also present, in places, in considerable quantities.

The principal economic minerals associated with the magnetite are the two copper sulphides, bornite and chalcopyrite. They occur in about equal quantities. They are distributed in grains and small patches throughout the whole lode, but are more abundant in some areas than in others. They occur both in separate grains and bunches, and are intimately intergrown.

Copper minerals, resulting from the alteration of the sulphides, are less plentiful at the Arctic Chief than at most of the other mines. The two copper carbonates, malachite and azurite, occur in small quantities at the surface and along the walls, but are seldom found in the interior of the lode. Cuprite, the red oxide, also occurs sparingly along the walls, and is usually associated with small quantities of native copper.

The iron sulphide, pyrrhotite, is occasionally found at this mine, in small masses enclosed in magnetite. The common zinc sulphide, sphalerite, also occurs, but is comparatively rare. No pyrite was observed.

The gold and silver values in the Arctic Chief are important. Assays invariably show gold in some quantity, the tenor ranging from traces, up to over two ounces per ton; and the whole lode probably averages over \$4 to the ton. The gold values are not influenced by the copper percentage, since ores high in copper, often carry light values in gold. Specks of native gold are occasionally found, both in the ores and in the crystalline limestone. The silver tenor of the ordinary shipping ores averages about two ounces per ton; and assays of 147 ounces to the ton have been obtained from the tetrahedrite vein in the lower level.

The average copper percentage of the Arctic Chief lode is difficult to estimate, but probably exceeds 4%. A selected shipment of 140 tons, made in 1904, gave returns of 0.39 ounce of gold, 2.5 ounces of silver, and 7.22% of copper. A shipment of 83 tons, made during the past season, yielded 0.18 ounce of gold, 2.00 ounces of silver, and 5.37% of copper.

The following partial analyses of Arctic Chief ores were made at the Ladysmith smelter:—

|     | Au       | Ag        | Cu    | SiO <sub>2</sub> | Fe     | Al <sub>2</sub> O <sub>3</sub> | CaO  |
|-----|----------|-----------|-------|------------------|--------|--------------------------------|------|
| (1) | 0.09 oz. | 2.45 ozs. | 8.13% | 8.60%            | 44.84% | 15.78%                         | None |
| (2) | 0.08 oz. | 1.12 ozs. | 3.57% | 6.60%            | 53.20% | 13.28%                         | None |

Claims in the vicinity of the Arctic Chief, developed to some extent, include the Whitehorse, Golden Gate, the Suburban in the Corvette group, and the Verona.

The two former belong to the same company operating the Arctic Chief, and extend southward from it. They are situated in a granite area, destitute, as far as known, of limestone inclusions. The croppings on both claims are similar, and consist of partially decomposed

granite, or diorite, seldom more than a few feet across, stained with iron and copper. Quartz, calcite, white mica, and chalcopyrite, are the principal minerals present. The workings consist of a few shallow pits.

The Suburban is situated east of the Arctic Chief, on a valley branching off from McIntyre Creek. The lime-granite contact line passes through it, and is well exposed in the steep southern bank of the valley. The contact here is very sharp, and nearly vertical. The bordering granites are not mineralized, and are comparatively fresh. The limestones near the contact are altered mostly into fine-grained magnetite and serpentine, stained with copper carbonates. The altered zone has a width of 4 feet, and is followed by 6 feet of limestone, beyond which is a second, narrow, copper-stained bed.

North of the valley the contact is bordered by a narrow garnetized band, containing some bornite, chalcopyrite, and magnetite. A shaft 50 feet deep has been sunk on the deposit.

The Verona, northeast of the Arctic Chief, is underlain mostly by basic granites or diorites, and limestones only occur as occasional inclusions. The granites bordering the inclusions are altered and partly replaced by epidote, garnet, augite, and other secondary minerals, including bornite, chalcopyrite, and magnetite.

A lens of magnetite, 30 feet in diameter, carrying copper minerals, occurs on the same claim. The lens is situated about 300 feet southeast of the line of limestone inclusions, and is surrounded by epidotized and garnetized diorite. No work has been done on it.

### The Grafter.

The Grafter ranks among the important mines of the district. It is situated about a mile north of the Arctic Chief, at an elevation of 730 feet above Whitehorse. A wagon road, 7.3 miles in length, connects it with the terminus of the railway at the latter point.

The Grafter was staked August 5 1899, by Wm. Woodney, and in the following year a shallow shaft was sunk on a small oxidized area near the eastern boundary of the claim. In 1901, the claim was bonded to a local syndicate, and in that, and the following year, the shaft was continued down to a depth of 50 feet, and a southwesterly drift from the foot of the shaft was carried forward for a distance of 137 feet. Work was resumed in the spring of 1907, by Robert Lowe, the present owner, and a considerable quantity of ore was mined, and shipped during the season.

### Geology.

The Grafter is situated in an area of narrow alternating bands of limestone and basic granite or diorite, all more or less altered. The intrusive here is a light to dark grey, rather coarse rock, mottled everywhere by dark areas, from a few inches to several feet in diameter. Most of these are basic segregations, but the angular character of a few of the larger ones suggests inclusions. Small light coloured aplite veins cut across both light and dark areas, and give the rock a very variegated appearance.

The intrusive is more basic than usual, the sections examined indicating a diorite, and in some instances, where augite is present in considerable quantities, a diorite-gabbro rather than a granite. The segregations consist mostly of hornblende, and a kaolinized plagioclase with some pyroxene, orthoclase, biotite and magnetite. Secondary minerals, mostly andradite, epidote, augite and actinolite, and copper sulphides, have de-

veloped in the granite near the limestone contact, and occasionally almost completely replace it.

The narrow limestone bands near the Grafter are enclosed in granitic rocks, and are altered into coarse, white and greyish marbles. In the immediate vicinity of the ore body, and at other points along the contact, the limestone is strongly mineralized, chiefly with andradite and varieties of pyroxene and hornblende. Besides these, a few nodules of serpentine, probably derived from the ferro-magnesian minerals, are also present. A peculiar, yellow banded variety proved on examination to be impregnated, in layers, with silica and iron.

### Workings

The workings on the Grafter consist of a shaft somewhat less than 100 feet deep, sunk on the ore body. At the 50 foot level, the ore body, which here describes a semi-circular course, has been followed for a distance of 150 feet, and has been stoped out in places nearly to the surface. A southwesterly drift, 137 feet in length, has also been run on the same level, to undercut a second surface showing. No ore was found in the drift, but more cross-cutting is necessary to prove definitely its existence, or non-existence, at this depth.

### Ore Body and Ores.

The Grafter ore body has developed near the end of a small limestone tongue, which penetrated the main granite area for a few hundred feet. The limestone at the extremity of the tongue is irregularly altered, portions of it being completely replaced by the ordinary assemblage of secondary minerals; while other portions, sometimes directly above, are almost free from them. The granites, or diorites bordering the limestone are also more or less completely replaced along a narrow intermittent zone by the same minerals which have developed in the limestones, and in some areas the present representatives of the two rocks are so similar that they cannot be distinguished in the field.

The ore body worked at present has formed around a core of nearly pure, white crystalline limestone, 28 feet across. Development work has not proceeded far enough to show whether the central limestone mass is entirely encircled or not. At the 50 foot level, ore has been followed continuously around one end of the core, for a distance of 150 feet. The ore body here has a maximum width of 17 feet, and with the exception of one lean stretch, at the end of the oblong limestone core, is seldom less than 6 feet in width.

The continuation downward of the ore body, to a depth of 90 feet at least, was proved by a shaft, sunk during the past season; and preparations were being made at the time of my examination to drift along it at that level.

The Grafter ores consist essentially of bornite and chalcopyrite, in varying quantities, disseminated through a hard garnet-augite-tremolite gangue. Malachite and azurite, cuprite and native copper, also occur in small quantities. Magnetite is common, but does not form large masses, and grains of pyrite, a somewhat rare mineral in the ore bodies, are occasionally found intergrown with the chalcopyrite. A small veinlet of quartz, carrying specks of native gold, was cut in sinking the shaft. The gangue minerals, besides those mentioned, include actinolite, canerinite, and epidote.

The copper minerals are usually most abundant close to the unaltered limestone, and the grade of the ores decreases gradually, as a rule, away from it, until they become too lean to ship. Occasional grains and bunches of bornite and chalcopyrite occur throughout the whole altered area.

The shipments from the Grafter to date, mostly made during the past season, have amounted to about 2,000 tons. The ore shipped carried from 6 to 8 per cent. of copper, and contained besides, values in gold and silver, averaging about \$3 per ton. It was practically unsorted.

The smelter returns of a couple of average shipments are as follows:—

| Lbs.         | Moist. | Dry W't. | Copper. | Silver.  | Gold.    |
|--------------|--------|----------|---------|----------|----------|
| 183,460 ...  | 1.5%   | 180,708  | 7.83%   | 1.88 oz. | 0.12 oz. |
| 221,370 .... | 1.3%   | 218,492  | 7.03%   | 1.64 oz. | 0.10 oz. |

### Claims in the Northern part of the District

#### The Pueblo

The Pueblo mine is situated in the valley of Porter Creek, near the northern end of the copper belt, at an elevation above the sea of 2,260 feet, and above Whitehorse of 570 feet. It is connected with the latter point by a good wagon road, 6.5 miles in length.

### History

The Pueblo concession was staked July 7, 1899, by H. E. Porter. The original discovery was made—so it stated—not on the great copper-stained hematite mass which now gives it value, but on an unimportant quartz vein situated near the eastern boundary of the concession. It passed, soon after being staked, into the possession of the Whitehorse Copper Company, and was almost immediately bonded—with fifteen other claims owned by the same Company—to the British-America Corporation. Some development work was done by the latter company; but the grade of the ore not proving satisfactory, the bond was thrown up. Early in 1906, the concession was bought by the Yukon Pueblo Mining Company, of Spokane, Wash., U.S.A., and a systematic exploration of the ore body has since been in progress.

### Development Work

The development work by the British-America Corporation consisted of sinking a shaft 70 feet deep, and drifting across the lode from the bottom of this. These workings were filled with ice and water at the time of my visit, and were inaccessible. The main drift extends about N. 19° W. from the bottom of the shaft, for a distance of 120 feet; and 30 feet from the face a shaft was sunk to a depth of 30 feet below the level of the drift. A second drift extends southwest from the bottom of the 70-foot shaft for a distance of 35 feet.

The long drift, and both shafts, are reported to be entirely in ore, while the short drift penetrates crystalline limestone. Work under the present management has consisted mainly in determining the surface outline of the ore body, and in removing the boulder clay which covers the eastern part of it.

### Geology

The Pueblo ore body is situated near the granite-lime contact; but appears to be enclosed entirely in crystalline limestone. Just how close it approaches the actual contact is not known, as the country east of it is heavily drift-covered. The first outcrop of granite—here a hornblende variety—occurs in an easterly direction, at

a distance of 380 feet, and in a northerly direction, at a distance of 270 feet. The limestone replaced by the ore body was originally cut by granite dykes, and partially altered portions of these are still recognizable. A porphyrite dyke, 2 to 4 feet in width, younger than the ore body, crosses it in a northerly direction. The dyke has been attacked by solutions containing copper, and is everywhere decomposed and copper stained. Portions of it, for a considerable distance below the surface, have been removed, and the space filled in with gravel and boulders.

The limestone in the vicinity of the lode is highly crystalline, and contains a few garnets, but is not rich in secondary minerals. The granites immediately bordering the limestone, descending Porter Creek valley, are also only slightly mineralized. Further down at a distance of 840 feet from the main ore body, an area of intense mineralization occurs. The granites exposed on the right bank of the Porter Creek are filled with secondary minerals, mostly garnets, for a distance of over 300 feet. Some iron, in disseminated grains and small bunches, carbonates of copper, and occasional grains of chalcopyrite, are also present. Limestones occur on the opposite bank of Porter Creek, and probably border the mineralized area, but the contact is concealed beneath the wash-covered flats of Porter Creek.

### Ore Body and Ores.

The Pueblo ore body, as exposed on the surface by present development, is an irregularly shaped mass, 300 feet in length, and 170 feet wide, near the centre. The surface section measures approximately 33,000 square feet. It has been proved to a depth of 100 feet. The horizontal section at this level is not known, as it was only reached by a single shaft. At the 70 foot level the dimensions probably equal those at the surface, as a drift 120 feet in length from the foot-wall failed to reach the hanging-wall. The general dip of the lode has not been definitely proven. The foot-wall near the shaft has a northerly inclination of about 60°.

The ore is essentially a cupriferous hematite, deposited in limestone by a metasomatic replacement of the latter. The replacement has been nearly complete, only occasional traces of the original limestone remaining. The replacement of a granite dyke which cuts the limestone is less perfect. Portions of the dyke have been wholly or partially altered to iron and other minerals, but in places its original character is still evident.

The hematite grades in texture from a fine compact variety to a coarse glistening specularite. It is always slightly oxidized, even at the lowest depth reached, but the oxidation is confined, as a rule, to the surface of the grains, and no complete conversion of the hematite to limonite has been effected, except at a few spots on the surface. An irregular silicification of the lode, by surface waters, has produced important changes in the character of the ore. Certain areas have been converted by this agency into hard siliceous masses.

The copper sulphides associated with the hematites have suffered more by alteration than the hematite itself, and have been largely altered into carbonates, oxides, and silicates. No bornite has so far been found, although this mineral was probably present originally, as it is common throughout the district. Chalcopyrite has also disappeared from the greater portion of the lode, but has been preserved in a few limited areas. The carbonates of copper, especially the green carbonate, are the most important economic minerals in the portion of the lode explored at present. They occur disseminated

throughout the hematite, and while more abundant in some portions than in others, nowhere form large, pure masses. The silicate of copper crysocolite is common, especially in the silicified portions. Cuprite, the red oxide, is sparingly distributed in veinlets, and small masses, through limited portions of the lode.

The alteration of most of the original copper sulphides into various secondary minerals, was accompanied by an impoverishment of certain portions of the lode and an enrichment of others, especially near the periphery. The grade on this account is variable, ranging from 1% up to 10%, or more. The smelter returns from a shipment of 700 tons, taken from different parts of the lode, gave 5 1-2% of copper, and 1 1-4 ounces of silver, while the average grade of the whole lode, so far as explored, probably approximates 4% in copper. The great excess of iron over silica—usually amounting to from 26%, to 30%—is an important feature of the ore.

The gold and silver values in the Pueblo ores are small, as a rule, although occasional assays show from \$1 to \$2 in gold, and from one ounce to three ounces of silver per ton.

No shipments were made from the Pueblo during the past season.

### The Anaconda.

This claim is situated west of Porter Creek, near the northern end of the copper belt. The principal development work consists of a long tunnel, driven westerly from the bottom of Porter Creek valley into the centre of a band of copper stained limestone which crosses the claim. No shipping ore was encountered, and the tunnel is now abandoned. During the past season the claim was under bond to Col. Thomas, of Pittsburgh, and a small amount of development work, principally stripping and trenching, was done.

### Geology.

The Anaconda is situated along the eastern side of the main granite belt, and is underlaid largely by granite of the usual character. Limestone outcrops along the north-eastern portion of the claim, and a spur of limestone from the main mass, 200 to 600 feet in width, crosses the claim in a diagonal direction. South of the limestone spur several small inclusions of lime occur in the granite.

The limestone is coarsely crystalline, and in places is irregularly mineralized, chiefly with garnet, augite, tremolite, and epidote, usually associated with more or less bornite and chalcopyrite, and carbonates derived from them. The principal mineral development takes place, as a rule, some distance away from the granite, and not at the immediate contact.

The limestone dips steeply toward the granite, and the bedding seems to have exerted an important influence on the mineralization. Certain beds are largely replaced by garnet, while others alternating with them have been converted into tremolite, augite, and the copper sulphides, and others again have not been affected, or only slightly. The bands replaced by tremolite are usually rich in copper minerals, and constitute the ores, while the garnet bands are only occasionally productive.

### Ores.

Croppings of copper minerals occur at a dozen or more points on the Anaconda claim, but have only been opened up by shallow pits and trenches, and practically

nothing is known of their behaviour in depth. A promising ore body, situated in the limestone, about 50 feet from the granite contact, was uncovered by trenching at a couple of points during the past season. The following section, measured along one of the trenches, illustrates the irregular manner in which the limestone is mineralized.

The principal ore body has a width of 12 feet, and is overlaid by limestone, and underlaid by a gabbro-porphyrite dyke. It consists mainly of tremolite, with subordinate quantities of augite and garnet, all carrying more or less bornite, chalcopyrite, and copper carbonates. Two small ore bodies, each about 3 feet in width, alternating with garnet and lime, parallel the main deposit, on the south. Other openings to the north and south, along the strike, show that the main lens carries its width for a distance of about 100 feet, and then narrows down. A shaft sunk on the lens to a depth of 30 feet, followed ore to the bottom.

Other lenses in the limestone, of more or less promise, have been trenched across, southwest of the one described, and one also occurs at several points in the bordering granite. The character of the croppings fully warrants further development work.

bodies, as usual, have developed. The limestone is crystalline, and at various points along the contact is partially replaced by augite, garnet, chalcopyrite, magnetite, etc. The grano-diorites have also been mineralized, principally with garnet and epidote, for varying distances back from the contact, but otherwise, present no special features.

#### Development.

The workings consist of a shaft, or steep incline, 92 feet in length, affording a depth of 84 feet. From the foot of the shaft exploratory drifts, totalling 270 feet in length, have been run in various directions, partly in ore and partly in more or less altered lime and diorite. Besides the main shaft, two other shafts, each about 20 feet in depth, have been sunk on promising outcrops of ore, and some stripping has been done.

#### Ore Body and Ores.

Copper minerals in some quantity are seldom absent from the exposed portion of the lime-grano-diorite altered contact zone on the Valerie. They are irregularly distributed, rich areas alternating with comparatively lean stretches. The upper part of the present

#### Claims in the Southern Part of the District—The Valerie.

This is the only claim in the southern part of the copper belt on which any considerable amount of development work has been done. It is situated west of the head of Miles canyon, and about three miles south of the Arctic Chief. A wagon road, two and one-half miles in length, to Wigan station, on the White Pass railway, was under construction during the season. The Valerie was staked August 22, 1899, by Gustave Gervais. The early development work consisted in sinking shallow shafts on the principal ore outcrops. From these 40 tons of high grade chalcopyrite ore were shipped, in 1904. Development work was resumed, in 1907, by Mr. A. B. Palmer, of Whitehorse, the present owner, and important discoveries of ore have since been made.

#### Geology.

The western portion of the Valerie is underlaid by limestone, and the eastern portion by hornblende granite, passing in places into a diorite, and it is along the ragged contact between these rocks that the ore

working shaft is sunk in an outcrop of chalcopyrite ore, 10 to 15 feet in width. At a depth of 25 feet, the ore ceased, and the shaft was continued through barren rock, mostly altered diorite, down to the present 84 foot level. Short drifts to the north and north-east, from the foot of the shaft, soon entered ore, and further exploratory work outlined a shoot of rich ore, approximately 50 feet in length, with a maximum width of 17 feet. An outcrop of ore on the surface, about 50 feet north-west of the shaft, probably represents the upward extension of this shoot. Three lenses, containing shipping ore, occur on the surface, while only one has so far been found in depth. It is probable that others will be discovered, when the present short drifts are extended farther along the limestone contact.

The ore shoot penetrated in the lower workings of the Valerie, is bordered on the south by a wide zone of altered and unaltered limestone, and altered diorite, impregnated with arsenical pyrites, in grains and bunches, associated with small quantities of chalcopyrite. The values in this belt are small, as the copper percentage is low, and assays show only traces of gold and silver.

The Valerie ores resemble those of the Pueblo, in consisting entirely of chalcopryrite, and derivative minerals. Accompanying these are mispickel, magnetite, augite, garnet, and calspar. No bornite has been found. The chalcopryrite aggregates are larger than usual, and occasionally form solid bunches, several inches across.

The derived minerals, mostly malachite, azurite, cuprite, and native copper, are fairly abundant, down to the lowest depth reached.

No shipments have been made from the Valerie since 1904, when 40 tons of selected ore, obtained from the surface workings, were sent to the smelter. This ore is stated to have averaged 18% copper, and over \$5 in gold per ton.

A considerable quantity of high grade ore was obtained from the exploratory drifts run during the season.

The equipment at the mines consists of a 20 h.p. boiler; an 8 h.p. hoist; and a No. 5 Cameron sinking pump.

## WHAT IS AN ORE?

By J. F. Kemp, D.Sc., Dept of Geology, Columbia University, N.Y.

(Annual Meeting, Canadian Mining Institute, Montreal, March, 1909.)

(Continued from Nov. 15th issue.)

The idea or condition of profit enters here, but it would appear that the authors intended to define an ore according to the condition that the metalliferous deposit should attract the attention of the miner; that is, it should be a deposit out of which at the outset the miner thinks he can make a profit, whether the result justifies his expectation or not. There is a possibility in this of which I will make further mention in conclusion.

We now come to a group of definitions which clearly treat of ore in the technical sense, and which base the meaning upon the possibility of profitable extraction or treatment. In Dr. Murray's New English Dictionary, 1905, the most comprehensive of its kind, we find:—

"Ore.—A native mineral containing a precious or useful metal in such quantity and in such chemical combination as to make its extraction profitable."

This definition is clear-cut and concise. We are reminded, however, that an ore is sometimes an aggregate of several minerals, any one of which perhaps if considered by itself would not be profitable, yet the sum total is. In the low grade copper ores of the Boundary district, the little gold and the little silver which are present are important factors in the total, yet no one of the three metals alone in these percentages could constitute an ore. It would have been well to have added after native mineral the expression "or aggregate of minerals" to allow for such cases.

In the "Universal Encyclopedia and Atlas," published by the Appletons in 1901, the following definition by Professor Thomas Eggleston appears. It is taken from Johnson's Encyclopedia published twenty years earlier and of which the Universal is the continued revision.

"Ore.—A metal chemically combined or in the native state, mechanically mixed with other substances, which render treatment necessary to separate it. In a strictly technical sense, only those substances are ores, which contain the metal in sufficient quantity and of sufficient purity to make the treatment profitable. Arsenopyrite, a combination of arsenic, sulphur and iron, contains 34.4 per cent. of iron, but it is not an ore of iron because the metal made from it is not of sufficient commercial value to pay the expense of treating it."

In the same volume the expression "ore deposits" is defined by R. Pumpelly and Charles Kirchoff along the same lines, but a distinction is drawn between ore and gangue.

In other works of similar scope, like the New International Encyclopedia, recently published by Dodd, Mead & Co., very much the same definition appears. "Ore Deposits, the name applied to deposits or accumulations of metalliferous minerals or ores found in the earth's crust. The term ore includes those portions of the ore body in which the metallic minerals form a sufficiently large proportion to make their extraction profitable; aside from these, there are often quantities of associated non-metallic minerals forming masses containing little or no metal, which are termed the gangue."

Authors of books on mining are inclined to look with favour on the same line of attack. In the "Manual of Mining," by M. C. Ihleng and E. B. Wilson, 4th Ed., New York, 1907, p. 3, after a paragraph treating of the native metals we find:—

"Ores.—With these few exceptions (i.e., the native metals) the metals are found in chemical union with non-metallic substances more or less completely segregated to constitute mineral. Any accumulation of mineral of good quality and in sufficient concentration to warrant the expenditure of energy for its extraction is an ore. Manifestly this is a fickle term since it depends for its stability upon the casual conditions of the market as well as upon the mineralogical features." In a glossary at the close of the work there appears: "Ore.—A mineral of sufficient value (as to quality and quantity) which may be mined at a profit."

The short definition from the glossary is a little infelicitous in form, and a little sweeping in statement. It would, of course, include coal, asphalt, ozocerite, and other non-metallics, which the greater number of us would certainly hesitate to call "ores."

The longer statement introduces the term "mineral," which deserves a word of comment. Aside from its general meaning under which are included substances of inorganic origin as against organic, the word mineral is used, in the United States at least, to designate in the large way the objects of mining, without special reference to profit or loss. Thus the law affecting the Public Lands recognizes "mineral claims," but either from a disinclination on the part of its framers to enter into the

question of profit or loss, or else from a desire to embrace also possible non-metallic deposits, mineral is consistently used instead of ore. Thus C. H. Shamel states in his valuable treatise on "Mining, Mineralogical and Geological Law," New York, 1907, pp. 55-56:—

"We may summarize the American law as to the legal definition and meaning of the word 'mineral,' when used in deeds, leases or other legal instruments, as including in the absence of special provisions in such instruments, all metallic minerals of sufficient value to justify mining and extracting the same, whether for the purpose of reducing the metal therefrom or some other industrial use. It also includes rock used for building materials, etc., coal, petroleum and natural gas. Kaolin, brick-clay, slate, etc., have not been passed upon by the American courts; but on the authority of the English cases, and the decisions of the land departments hereinafter mentioned, the probabilities preponderate that the courts will hold them to be included under the term 'mineral,' the same as granite, marble, etc."

In the paragraphs immediately following in the work cited, Dr. Shamel reviews the meaning of "ore" in the few cases in which it has been defined by the courts. The definitions are in the purely scientific rather than in the technical sense. The courts apparently prefer "mineral" to "ore," wherever possible.

A definition very similar to the one from the glossary of Ihlseug and Wilson, is to be found on p. 598 of the "Coal and Metal Miners' Pocketbook," which is published by the International Correspondence Schools of Scranton:—

"Ore.—A mineral of sufficient value (as to quantity and quality) to be mined at a profit."

As remarked above, this definition of course includes all manner of non-metallic minerals.

Several definitions from works on ore deposits will perhaps not be without interest. Thus in "A Treatise on Ore Deposits" by J. Arthur Phillips, 2d Ed., revised by Henry Louis, 1806, p. 1, we find:—

"Metals which occur in a state of approximate purity are said to be native, and when two or more such metals are found in combination the substance is called a native alloy. Usually the metals sought after by the miner are, however, not found in the native state, but are mineralized by being united with various non-metallic bodies. In this way they combine with sulphur or chlorine, giving rise, respectively, to metallic sulphides or chlorides; with oxygen the metals form oxides, and with acids they yield salts, such as carbonates, sulphates, and phosphates."

"All natural combinations of a metal with such mineralizing substances are called ores when the proportion of metal which they contain, after suitable mechanical preparation, is sufficiently large to admit of their being advantageously treated by the metallurgist. Although perhaps not strictly correct, any material obtained by mining that contains a workable proportion of a metal is often called an ore, even if the whole of the metal be present in the native state."

"This definition perhaps unconsciously so far as its writer was concerned, contrasts the point of view of the metallurgist with that of the miner. But it is a contrast of which we shall need to take cognizance. Thus a miner might extract a quantity of metalliferous minerals from the ground at a loss. He might sell them to a metallurgist at such a price that the latter could profitably treat them. They might thus not be ore for the miner, although ore for the metallurgist. If you saw a pile of magnetite at a blast furnace being successfully treated

you would call it ore, even though it had been bought at the bankrupt sale of some miner."

In W. H. Weed's translation of Richard Beck's *Lehre von den Erzlagern*, under the title, "The Nature of Ore Deposits," New York, 1895, p. 1, we find the following:—

"In a mineralogical sense an ore is a metalliferous mineral or a mixture of such minerals. Practically, however, this definition of an ore must be qualified by the statement that only those minerals and mixtures of minerals are ores from which metals or metallic compounds may be produced on a commercial scale and at a profit."

Two examples of equal mineralogical or petrographic value may differ materially; a basalt carrying enough magnetite to influence the magnetic needle, but yet containing less than 10 per cent. of iron, is far from being an iron ore. On the contrary, a vein with a silver content of only 0.5 per cent. is an ore deposit since with this content it is commercially valuable. In the case of a gold deposit the amount sufficient to distinguish a gold ore from barren rock may be even less, for in California and Dakota gold ores with only 4 to 6 grains per ton of gold are exploited. Hence it is the economic point of view that must always be borne in mind, the profit of working being subject to variation in the course of time. While nickel and cobalt were formerly nicknames for materials which were thrown upon mine dumps as useless, and were considered as a mere nuisance in silver mining, to-day, the compounds of these metals and the associated minerals are in great demand as ores.

To a certain degree a mineralized material may be an ore in one locality and yet not be an ore in another place, the cost of reduction depending on the proximity to lines of traffic and cheap freights.

The science of ore deposits is, in other words, the study and consideration of the deposition, distribution, and origin of rock bodies containing ores in such quantities that they may be extracted profitably by mining operations."

Heinrich Ries, in his "Economic Geology of the United States," New York, 1905, p. 223, gives the following:—

"Definition.—The term, ore deposits, is applied to concentrations of economically valuable metalliferous minerals found in the earth's crust, while under the term, ore, are included those portions of the ore body of which the metallic minerals form a sufficiently large proportion to make their extraction profitable. A metalliferous mineral or rock might therefore not be an ore at the present day, but become so at a later date, because improved methods of treatment or other conditions rendered the extraction of its metallic contents profitable."

R. H. Stretch, in his handbook on "Prospecting, Locating and Valuing Mines, 4th Ed.," New York, 1903, p. 206, writes in this way:—

"An 'ore,' strictly speaking, is a single mineral which is a chemical compound of a useful metal and some other element or acid. In common usage, however, complex mixtures of pure minerals are considered as single ores; while free gold, native silver and native copper, together with their accompanying gangue minerals, are also classed as ore. Among miners, whatever will pay to treat or ship and sell is considered ore, as also low-grade mineral which might be utilized by concentration or improved facilities; but there is an indefinite shading off into material containing traces of ore minerals, but hopelessly unavailable, and this is not considered ore; neither are gold gravel or platinum sands called ore. To avoid

misunderstanding it is best to distinguish between the 'ore' (meaning thereby the whole bulk of the available product) and the 'ore mineral' (usually very much smaller in quantity in all ores except those of iron, manganese, and some lead and zinc ores)."

Probably with search a few other definitions might be found, but without adding anything essentially new or important. I think that we must conclude that a distinction should be drawn between the purely scientific use of the word and the technical. Not every metalliferous mineral is an ore even in the former sense. Many can be cited which it would be ridiculous to call by this name. Nor can a metalliferous mineral be called an ore unless at some time it has proved to be a practicable source of some metal. Once successfully used, it establishes its standing and joins the group of the ores. This differs from Professor Dana's definition that in an ore a metal should be a prominent constituent, since a species of amphibole might have 5 or 10 per cent. of iron, iron being thus a prominent constituent, and yet not be an ore. I suggest the following:—

"In the scientific sense an ore is a metalliferous mineral belonging to the group of those which have profitably yielded the metals to the miner or metallurgist."

"In its technical sense an ore is a metalliferous mineral or an aggregate of metalliferous minerals, more or less mixed with gangue, and capable of being, from the standpoint of the miner, won at a profit; or from the standpoint of the metallurgist, treated at a profit."

The test of yielding the metal or metals at a profit seems to me in the last analysis to be the only feasible one to employ. In a new enterprise, as we all know, it is customary to refer to the mineral in the ground as ore, before it is proved to be such by profitable operation. If the enterprise should subsequently prove unsuccessful, it would only remain for those engaged in it to say that they thought they had ore, but that they had made a mistake. As soon as a shifting or variable standard is introduced, such as individual beliefs or expectations, such uncertain, changeable and on the whole unsatisfactory conditions are developed that a sharp definition upon a secure and unmistakable basis becomes an impossibility. On the other hand, the test of profit certainly meets the requirement that "Use is the law of language."

## AN ENGLISH OPINION OF MINING IN NORTHERN B.C. AND THE YUKON.

At the recent general meeting of the White Pass and Yukon Railway Company, Ltd., held in London, Mr. S. H. Graves, referring to the mining possibilities of the regions served by the W. P. & Y. Railway, expressed himself as follows:

The year has opened up new sources of encouragement for the future in several directions. In the Klondike district the Guggenheim plant has been in successful operation throughout the season, and I understand that the results have more than come up to expectations, and are likely to lead to further installations on a large scale. The same is true of the working of the dredges in the Stewart and Forty Mile districts. But perhaps of even greater promise for the future is the work which has been done in the way of quartz development in the Klondike district, which, as you know, has so far been dependent upon its gold bearing gravels. For several years work of a more or less desultory nature has been done on various gold ore veins and prospects in the Klondike district without

any very definite results, but a year ago work on a serious basis was commenced on what is known as the Dome lode where the surface croppings were considered sufficiently encouraging to warrant exploration at greater depths. With this in view a tunnel was started to crosscut the surface veins at several hundred feet in depth, and this tunnel has been driven into the side of the mountain a distance of about 1,200 feet during the past season, and has already encountered some of the veins. But in order to prove the surface croppings it will be necessary to drive the tunnel probably about 500 feet further. The work so far as it has gone seems to indicate the continuity of the surface formation, and gives good hope of developing a gold mine of first-class importance. On another Klondike quartz property the Lode Star mine in Victoria Gulch, they have already commenced taking out ore, and the first crushing, I understand, averaged about \$17 per ton. You will therefore see that there is ground for hope that the Klondike will repeat the history of other important placer camps and develop from a placer into a quartz mining district. In the Atlin district most of the hydraulic plants were worked last summer with satisfactory results and increased outputs. The Guggenheim plant on Pine Creek was under reconstruction, but I understand that everything will be finished in time for it to be in active operation next season.

In the Windy Arm silver and lead ore district a new company has been organized for the purpose of working the "Venus Extension," and I am informed that the intention is to instal a plant on the property with a view to active operation. But the most important work of the season in this district has been in connection with the development of the "Big Thing" mine, situated about seven miles south of Caribou Crossing on our railway, with which place the Yukon Government is connecting it by a road. The owners of this property are men of means, and as the result of last summer's work it is now proposed to instal an air compressor and ship ore on a moderate scale during this coming winter, with a view subsequently to connecting the mine with our railway by tramway, and shipping on a large scale should these preliminary shipments prove satisfactory. For several seasons a good deal of attention has been attracted to the Wheaton district, situated about 20 miles west of Robinson, a station on our line, with which place it is connected by a good road. Considerable development work was done last summer on some of the properties in this district, and the results are most encouraging for its future. Many competent judges think that it is destined to become a quartz mining camp of great importance, and there can no longer be any doubt as to the existence of large bodies of highly mineralized ore. In the White Horse copper district operations are still restricted by the difficulty of procuring capital consequent upon the low price of copper. But the work done has demonstrated that some of the mines could ship steadily at a profit even at the present low price of copper, and negotiations are pending in connection with several of the properties which, if carried through, are likely to result in steady ore shipments in the near future. From what I have said you will realize that during the past year in no less than four widely separated and important mining districts on our line substantial progress has been made towards the development of permanent quartz mining and its attendant industries, while at the same time the output from the workings of the gold-bearing gravels of the Yukon by modern machine methods continues to increase.

## COAL MINE ACCIDENTS AND THEIR PREVENTION.

Address Delivered Before the National Civic Federation  
in New York, November 23.

By J. A. Holmes, expert in charge Technologic Branch,  
United States Geological Survey.

Our coal industry in its phenomenal growth has nearly doubled during each succeeding decade of the past 60 years. It has had to do more than keep pace with our increasing population, for, while it supplied less than one ton per capita to the American people in 1880, it has had to supply nearly six tons per capita during 1908. Its growth has been too rapid for systematic development; and the industry to-day represents a great host of scattered, warring, discouraged elements, without organization or co-operation.

In this industry are now employed some 600,000 miners, who work at some 6,000 different mines, and produce yearly about 500,000,000 tons of coal.

Not only is the nation increasingly dependent upon this coal for its heat, light and power for its manufacturing industries and transportation facilities, but this coal and other mineral products now contribute in tonnage more than 65 per cent. of the total freight traffic of the country.

The economic conditions upon which coal mining is based in this country are fundamentally bad; and the evil consequences are so far-reaching as to both time and extent, and are so essentially national in character, that this subject demands the earnest consideration of our best statesmen, as well as of our best engineers.

(1) In spite of this rapid growth in our demand for coal the normal productive capacity of our coal mines under continuous operation greatly exceeds this demand;

(2) Ruinous competition exists not only between the operators in the same field, but between the operators of one field as against those in another field, or in another State, where different mining laws and regulations exist;

(3) This competition is first of all driving out of the business the small operators except where they find protection under local freight rates; and is forcing even the larger operator to mine coal under conditions which he cannot approve but from which he finds no escape. If he and his fellow-operators endeavor to "get together" and place the price of coal at the mine on a reasonable basis they go to jail under either a Federal or a State statute; and as the only alternative each must live (or succumb) by underbidding the other, which he can do only through wasteful and unsafe mining methods;

(4) Even when the demand for coal and the prices are at their best, under existing conditions, the operator can mine only that part of his coal which can be taken out most cheaply and sold at higher prices; and the remainder must be left underground in such shape as may preclude its future recovery. And thus we waste yearly more than 250,000,000 tons of the nation's fuel supply;

(5) The American mine owner is as humane as is the mine owner of any other country; and he would like to follow every practice and use every appliance for safety to be found in Britain, or France, or Belgium, or Germany, or elsewhere; but he pays his miners higher

wages, and at the same time receives for his coal at the mine less than half the price received for similarly mined coal by the operator in these countries; and he must employ miners an increasingly large percentage of whom come to him unfamiliar either with the practices of the industry or with the language or traditions of the country;

(6) And the penalty which the nation is paying for this bad system is this increasing waste of resources and the still more unpardonable increasing waste of human life—the yearly loss of 250,000,000 tons of coal, and the killing or injuring yearly of from 8,000 to 10,000 men.

And what are the remedies for this bad situation?

(a) Investigations, such as are now being conducted by the government, as to the causes of mine explosions; and other similar investigations as to the causes of mine accidents of other kinds, and as to methods of prevention;

(b) Educational work among the miners and the lower active mine officials as to these causes and remedies;

(c) The training of men at each mine as to the best methods of using explosives, using electricity, handling of gases and dust, of timbering, of preventing and extinguishing mine fires; as to the methods of rescue work, and as to the methods of first-aid-to-the-injured work;

(d) The development of better and more uniform mining laws, rules and regulations, based upon accurate data and experience;

(e) Active, determined co-operation between the miners and the mine management and the State's inspectors in the enforcement of these rules and regulations with a view to the maintenance of the safest possible conditions in every mine.

The above are all parts of the program for lessening and alleviating mine accidents; but they do not complete the program. It is an essential part of this program that:

(f) The ruinous competitive system upon which coal mining in the United States is based at the present time should be changed, and that the price paid for coal at the mine should be such as will permit and secure safe and efficient mining—mining unaccompanied by either this large loss of life or waste of resources—mining which can have due regard to not only the safety but also to the health and the comfort of the men who toil underground and whose labour is so essential to the welfare of the nation. All this can be done without adding appreciably to the burden of the average American citizen; without any increase in the price of coal at the poor man's cottage, and without the risk of any unreasonable restraint of trade.

There can be no permanent industry without reasonable profits. It is unjust and irrational that in this great and essential branch of industry, reasonable profits should be dependent upon any unnecessary sacrifice of human life, and unnecessary waste of resources which we can neither replace nor restore and which will be essential to the future development of the country.

This industry needs and deserves fair treatment at the hands of the American people, and upon its receipt of such treatment depends in no small degree not only the welfare of the operators—though nobody cares about them—but also the welfare of the 600,000 miners who risk their lives in supplying the fuel for the nation's comfort and convenience.

## BOOK REVIEWS.

**The Metallurgy of the Common Metals—Gold, Silver, Iron, Copper, Lead and Zinc.** By Leonard S. Austin. Second edition, revised and enlarged. 500 pages. 195 Illustrations. \$4 post paid. Mining and Scientific Press, 667 Howard Street, San Francisco.—1909.

Only by contrast and careful revision can a scientific text-book be kept approximately abreast of the times. Only the books that have filled satisfactorily their niche in the worker's library see more than one edition. In other words, except in the case of books prescribed for use in schools and colleges, the number and size of successive editions may be considered as quantitative measures of merit.

"The Metallurgy of the Common Metals" was published in May, 1907. Its second edition, revised and enlarged, is now being distributed.

The volume, in its first edition, outlined processes for winning the common metals from their ores and then refining them. In its second edition, the subject of thermo-chemistry is given fuller treatment, the description of the cyanide process has been amplified, improvements in milling methods noted, and the commercial aspects of various metallurgical methods more adequately dealt with.

Professor Austin's book is a general guide to the study of metallurgy. It covers a wide range of subjects; but it also elucidates plainly broad principles and general practice. To the student it is of particular difficult study. The operating metallurgist will find value, as it presents a bird's-eye view of a complex and much that is suggestive in its pages.

"The Metallurgy of the Common Metals" is the only up-to-date handbook covering the field indicated by its title. Its author has kept in view the practical phases of his subject. While one or two chapters, notably that on "Iron," are a trifle too sketchy, yet, on the whole, the author has exercised excellent judgment in choosing, condensing, and presenting his material.

**The Cost of Mining—An Exhibit of the results of Important Mines throughout the World.** By James Ralph Finlay. 415 pages. Illustrated. \$5 post paid. McGraw-Hill Book Company, 239 West 39th St., New York.—1909.

"The Cost of Mining" is the outgrowth of discussions and correspondence that appeared during the past six years in a contemporary mining periodical. "While all of the material in this book is either old or public property to the extent of being known to at least a portion of the profession, there is nevertheless something new in it in that it presents a view of the economics of mining on a grand scale and in broad outline." This quotation from the preface sums the aim of the author.

Mr H. C. Hoover's recent work on the "Principles of Mining" has proved most acceptable as a resume of the processes of valuation, organization, and administration used in mining enterprises. Mr. Finlay's "Cost of Mining" makes an excellent companion to Hoover's "Principles."

**Contents.**—Mr. Finlay has drawn freely upon mines in all parts of the world for data and examples. His twenty years of experience has been unusually varied.

After general consideration of valuation, costs, etc, certain specific branches of mining are analyzed. These branches are the mining and production of coal, iron, copper, lead, silver-lead, zinc, gold and silver. The table of contents is as follows:—

- Chapter I.—Value of Mining Property.
- " II.—Factors Governing Variations.
- " III.—Partial and Complete Costs.
- " IV.—Statistics of Coal Production.
- " V.—Cost of Mining Coal.
- " VI.—Cost of Mining Lake Superior Iron.
- Chapters VII. to XII. deal with various Copper Districts.
- Chapter XIII.—The Copper Mining Business in General.
- " XIV.—Lead.
- " XV.—Silver-Lead Mining.
- " XVI.—The Cost of Silver-Lead Mining.
- " XVII.—Zinc Mining.
- " XVIII.—Occurrence and Production of Gold.
- " XIX.—Quartz-Pyrite Gold Mines.
- " XX.—Cripple Creek, Kalgoorlie and Goldfield.
- " XXI.—Silver Mining at Cobalt and Guanajuato.

**General.**—In his introductory chapter, "Value of Mining Property," Mr. Finlay first emphasizes the vastness of the "real mining business—the great bulk of which the precious metals constitute only small percentages." He then proceeds to demonstrate the fundamental importance of considering all the factors that affect investment. For instance, the price of any product must be carefully averaged over periods of years before probable future fluctuations can be safely approximated. Low prices need not mean corresponding loss. Various factors in mining, such as the shipment of selected rich ore to smelters when low prices prevail, help to maintain profits.

In tracing the general relation of cost to price, Mr. Finlay illustrates his points aptly. For example, copper is produced for 10 cents a pound. When copper stands at 15 cents a pound the normal profit is 5 cents. Suppose that copper goes up to 20 cents a pound. Generally this rise is due to a shortage of ore or to a shortage of labour, or to both. Immediately each mine, under the stimulation of a higher price, undertakes the working of a proportion of ore of lower grade than would be payable with copper at 15 cents. Consequently costs are very much increased, and profits are relatively lessened. Developing the theme further, Mr. Finlay shows that in these circumstances costs may be so augmented as to absorb the whole advantage of the increased price.

Diminished cost per ton, due to larger scale of operations, hardly ever results in an increased profit per ton. This and similar propositions are dwelt upon. The nature of mining investments is stated, and the determination of present value from known factors is set forth. Here we shall quote an axiom, tersely stated by Mr. Finlay: "The general principle at the root of the matter is that the annual dividends must yield a good annual interest on the sum invested, and also permit a certain sum to be set aside each year, which

securely invested at compound interest will repay the investment when dividends cease on the exhaustion of the mine."

Chapter II. commences with a definition of the cost of mining, which runs in part as follows:—“(a) The use of capital in acquiring the opportunity to mine, i.e., ownership of ground, or leases. (b) The use of capital for equipping and developing a mine, for providing mills and smelters. (c) Current operating costs, including taxes, the maintenance of company organization, insurance, litigation, etc.” For purposes of discussion, Mr. Finlay confines himself to “The complete cost of developing, equipping, and working out a mine, allowing interest on the capital required for these purposes until it is returned in dividends.” Dividing factors governing variations into two groups, external and internal, Mr. Finlay proceeds to set forth the elements of a complete cost statement.

“Partial and Complete Costs” is the caption of Chapter III. Costs chargeable to operating, maintenance, depreciation, and amortization, dividend and selling costs, depreciation, amortization are dealt with. The concluding section is written for the investor, and is cogent and pointed.

Various classes of coal mines, iron mines, and copper mines are then discussed. Actual cost statements are adduced. Particularly interesting are the conclusions reached in Chapter XIII.: “(1) No copper can be produced in North America under present economic conditions at a profit for less than 10 cents a pound. (2) At 11 cents a pound only half the present output can be produced. (3) At 12 cents many of the largest producers would only be getting a new dollar for an old one. (4) At 15 cents the business as a whole is prosperous and profitable only to an entirely legitimate degree. (5) As long as the demand increases as it has increased steadily for the past quarter century, it is safe to count for the next ten years on an average price of 15½ cents, which has been the approximate average for the last ten years.”

The last chapter is a comparison of silver mining at Cobalt and Guanajuato. Cobalt is taken as an example of high mining costs. The Kerr Lake Mining Company's statement for the year ending August 31st, 1908 shows that the ore mined, 528 tons, cost about \$579 per ton, including all plant and machinery investment charges. The silver content per ton was 2,790 ounces. The total cost of mining worked out at less than 21 cents per ton. The present cost of silver per ounce at the Guanajuato mines is roughly 50 cents. The operating expenses per ton of ore are about \$521. The average ore is worth \$7 or \$8 per ton.

\* \* \* \* \*

“The Cost of Mining” is undoubtedly a thoughtful exposition of a subject to which far too little thought is given in this country. It abounds in suggestions and statements that will make the investor sit up.

The statement that low costs in mining may mean greater expense elsewhere, that low wages do not mean low costs, and so on, will, no doubt, sound paradoxical to many. Mr. Finlay establishes their accuracy.

In general treatment and in diction, “The Cost of Mining” leaves little to be desired. The arrangement might have been improved. Incidentally, there are several printer's errors that distress the eye. But, on its merits, Mr. Finlay's new volume is entirely worth while.

## THE KOPPERS BY-PRODUCT COKE OVEN AT SAULT STE. MARIE.

After thoroughly investigating the different systems of by-product coke ovens, the Lake Superior Corporation placed a contract for the erection of a by-product plant at Sault Ste. Marie, Ont., Canada, with H. Koppers of Joliet, Ill., whose ovens and by-product plant are used by the Illinois Steel Co., at Joliet, and also adopted by the Steel Corporation at their plant at Gary, Ind.

The plant at Sault Ste. Marie will consist of 110 ovens, arranged in two batteries, each of 55 ovens. The type of ovens will be the same as is being erected at Gary, Ind., the size of each being 37 ft. between doors, 17 inches at pusher end, 21 inches at quenching end and 9 ft. 10 3-8 inches at top of arch. The cost of the plant will be about one and a half million dollars.

The charge of coal for each oven will be about 13 tons, making a total charge for the 110 ovens, of over 1400 tons of coal.

The yield of coke per oven will be about 10 3-4 tons, or nearly 1200 tons per day. For the generation of industrial power, nearly 10,000,000 cubic feet of surplus gas will be available. Indicated by heat units, the quality of this gas is 500 B.T.U. per cubic foot, and represents a heat value of about 200 tons of good coking coal.

Koppers improved method of recovering the by-products will be adopted at this plant. The distinguishing feature of this system, is the extraction of ammonia direct from the gas, in the form of sulphate of ammonia, without the employment of the water scrubbing process.

An improvement in the coke quenching arrangement will also be instituted, so that instead of having a coke bench, the coke will be pushed into a coke quenching car.

It is expected that the plant will be in operation by January 1911.

## CANADIAN PATENTS.

The following is a list of Canadian patents issued on November 23rd, 1909, relating to mining and metallurgy and furnished by Fetherstonhaugh & Co., 5 Elgin Street, Ottawa, Canada. Russel S. Smart, resident, from whom all information may be obtained:—

122012.—V. Raisin, Paris, France, apparatus for the separation of acetic and formic acids assigned.

122016.—T. C. Johnson, New Haven, Conn., fire arms, Winchester Repeating Arms Co.

122057.—D. Belloni, Edri, Pa., systems of mine ventilation.

122112.—J. S. McIlgenny, Washington, D.C., methods of treating gas.

The following is a list of Canadian patents issued on November 16th, 1909, relating to mining and metallurgy, and furnished by Fetherstonhaugh & Co., 5 Elgin Street, Ottawa, Canada, Russel S. Smart, resident, from whom all information may be obtained:—

121968.—J. C. Clark, Atlanta, Ga., pulverizing mills.

121906.—W. H. Paul, Birkenhead, Eng., treating grain for milling.

121982.—H. W. Doughty, Amherst, Mass., methods of treating wood during distillation. H. W. Doughty and F. E. Waters.

### PERSONAL AND GENERAL.

Mr. G. Brewer Griffin has recently been appointed manager and actively is directing the sales policy of the Detail & Supply Sales Department of the Westinghouse Electric & Mfg. Co., in which department transformers, meters, fans, heating appliances, switches, switch-boards, railway line material, etc., are sold. Mr. Griffin has been assistant manager of this sales department for six years past, having previously been connected with the sale of detail apparatus in the Boston office, altogether having been employed some 7 years with this company. Previous to his connection with the Westinghouse Company, Mr. Griffin was with the Manhattan General Construction Company of New York as a special representative, finally opening an office for them in Boston.

Mr. Samuel A. Chase, who for the past few years has been with the Westinghouse Electric & Mfg. Company in their New York Sales Office as a special detail and supply salesman, has recently resigned to accept a position with the White Investing Company, of New York City, a financial investment company handling stock of many different organizations. Previous to Mr. Chase's employment with the Westinghouse Electric & Mfg. Company, he was a salesman for the Western Electric Company, where he was highly successful.

Mr. S. L. Nicholson has recently been appointed general sales manager of the Westinghouse Electric & Mfg. Company, and has direct charge over the sales policies of the entire company. Mr. Nicholson has been with the company for 11 years in many different capacities, as salesman, as district department manager, and as industrial and power sales manager for the past five years, from which last position he resigned to take the present post. Before coming to the Westinghouse Company he was with the C. & C. Electric Company. He is perhaps best known to motor manufacturers as the organizer and President of the American Association of Motor Manufacturers, an organization which has done much in the two short years of its life to improve the art of manufacturing motors.

Mr. Charles Robbins who has for many years been connected with the Westinghouse Electric & Mfg. Co. in the industrial and power sales department, in connection with the sale of industrial motors, has recently been appointed manager of this department. Mr. Robbins has been with the company since 1899, in which time he has been in the manufacturing department, the New York district office sales department and for the past three years in the industrial and power sales department at East Pittsburg. His headquarters will continue to be at East Pittsburg.

Mr. A. D. Miles, mining engineer, Sudbury, Ont., was in Toronto on December 7th.

Mr. R. B. Lamb returned to New York on December 8th.

Mr. J. D. Ramsay has accepted an appointment as manager of Rand Klipfontein Mining Company in the East Rand.

Mr. C. B. Willmott, Sault Ste Marie, has returned from British Columbia where he was engaged in examining mining prospects for United States clients.

The Soledad Mining and Milling Co. of Mexico has installed complete mills for amalgamation and cyanidation, the machinery consisting of four Nissen stamps, 1,500 lbs. each, machinery complete for regrinding, steam power plant, electrical equipment, the complete order being placed with Fairbanks-Morse & Co.

The Canadian Fairbanks Co., Limited, beg to announce that they have been appointed the exclusive sales agents for Canada for Dicks' Balata Belting and have purchased the business of J. S. Young. All orders in the future should be sent direct to their nearest branch house. Large stocks are carried at the present time at Montreal and Vancouver, and stocks are on the way to the branches at St. John, N.B., Toronto and Winnipeg.

All mineral collections for the Leonard Prize should be forwarded to the Provincial Assayer at Belleville not later than Dec. 31, 1909.

### AN INSTRUMENT FOR DETERMINING VERTICAL DEPTHS IN DIAMOND DRILL HOLES.

In the construction of the new aqueduct of the city of New York, which crosses the Hudson River just north of West Point, it became necessary to determine accurately the vertical depths of the narrow diamond drill bore holes which are being sunk under the Hudson River at various angles and which have already reached depths of 1,500 feet.

This problem has been solved by Professors G. N. Lewis and H. T. Kalmus, of the Massachusetts Institute of Technology, who have devised a self-recording pressure gauge which has a diameter of less than  $\frac{7}{8}$  in. and can therefore be placed directly in the terminal section of the drill rod. Since the bore holes are constantly filled with water, the maximum hydrostatic pressure recorded is a direct measure of the vertical depth. It seems probable that this instrument may be of service in other engineering and mining work where it is desirable to determine the vertical depth of bore holes used in prospecting.

The pressure gauge proper consists of a very thin strip of tempered steel bent into the form of a hollow rectangular tube approximately  $\frac{3}{4}$  in. wide, 1-32 in. thick, and 18 in. long. The edges and the lower end of the tube are welded together with the oxyacetylene flame. Into the upper end is welded a small steel tube which in turn is sealed to a straight glass tube, the upper end of which enters an air-tight chamber. The gauge and connecting glass tube are filled with mercury and when subjected to an external pressure the thin steel walls of the gauge undergo considerable temporary deformation, thus diminishing the total volume of the gauge and forcing the mercury from the upper end of the glass tube into the surrounding chamber. When the pressure is released the gauge resumes its original volume and the mercury level in the glass tube falls through a distance which measures directly the pressure to which the apparatus has been subjected. The mercury may now be returned to the glass tube from the surrounding chamber by a simple device.

The instrument gives remarkably reproducible results and is able to record vertical depths up to 1,500 feet with an error of no more than 2 or 3 feet. On account of the extremely small volume of the thin steel gauge, the effect of temperature changes, even amounting to 30 or 40 degrees, is entirely negligible.

### EUROPEAN PETROLEUM.

The production of petroleum by European companies for the week ended October 31st was 1,931 tons.

## SPECIAL CORRESPONDENCE

## NOVA SCOTIA.

**Glace Bay.—The U.M.W.A. Strike.**—In November the mines of the Dominion Coal Company produced 221,000 tons of coal. The figures for the strike period, brought down to date, are as follows:—

|                 | Total Output. | Average<br>Daily Output. |
|-----------------|---------------|--------------------------|
| July .....      | 136,000       | 4,200                    |
| August .....    | 154,000       | 5,900                    |
| September ..... | 180,000       | 7,200                    |
| October .....   | 205,000       | 8,200                    |
| November .....  | 221,000       | 9,100                    |

The outputs of the individual collieries compare with November of last year, as under:—

|             | 1908.   | 1909.             |
|-------------|---------|-------------------|
| No. 1 ..... | 38,226  | 49,034            |
| " 2 .....   | 54,309  | 49,970            |
| " 3 .....   | 18,323  | 20,369            |
| " 4 .....   | 31,171  | 26,196            |
| " 5 .....   | 26,385  | 30,675            |
| " 6 .....   | 12,224  | .....             |
| " 7 .....   | 13,507  | 592               |
| " 8 .....   | 12,366  | 10,660            |
| " 9 .....   | 24,444  | 15,597            |
| " 10 .....  | 13,359  | 12,594            |
| " 12 .....  | 2,025   | 3,651             |
| " 14 .....  | .....   | 1,836             |
|             | 246,339 | 221,200 (approx.) |

On looking these figures over it will be seen that a number of the collieries show an increase over last year's tonnage, and at others the figures closely approximate. No. 6 Colliery is still idle.

**Report of the Deputy Minister of Labour.**—Considering the extremely complicated issues which have brought about the U.M.W.A. strikes in Nova Scotia, the Deputy Minister of Labour has presented to Parliament a report which mirrors the conditions attending the labour disputes at the Nova Scotian collieries very clearly, and Mr. Acland is to be congratulated on having compiled so lucid an account from the conflicting statements which he no doubt met with. At Glace Bay he finds that the strike is "practically broken" and that "the majority of those on strike will be surplus labour during most of the winter." Mr. Acland makes one pertinent annotation—the report says "in twenty-six years Secretary Moffatt says there has been no Provincial Workmen's Association strike calling for financial assistance. These figures justify the claim that the organization has not encouraged strikes, while they are also used to support the contention that the organization (that is, the P.W.A.) was ineffective." "Here," remarks Mr. Acland, "the real test would lie in the relative value of the conditions of work secured in Canada without formal strikes, and in the United States where a more aggressive policy is pursued." When Mr. Lewis, the present President of the U.M.W.A., was in Glace Bay last spring he told an audience of miners that he had found the condition of the miners and their work to be better in Nova Scotia than in the United States. Mr. John Mitchell, late leader of the same body, has just delivered himself of a pronouncement on coal mining conditions in the United States which, if it be only half true, points to a great need for reform in the coal industry in the United States. Mr. Mitchell says "coal mining is the most hazardous industry in America." He points out that since 1839 coal mine disasters in the United States have resulted in the death of 23,000 persons and serious injury of 50,000, and he re-

fers to the extraordinarily high proportionate death rate in the coal mines of the States compared with that in other countries. Mr. Mitchell says: "This proportionate death rate from accidents is attributable to two things—the inadequacy of the laws and the laxity of their enforcement, and to the fact that unskilled emigrant labour is employed in the mines." Reference is also made to a bill which was introduced into Congress to encourage the introduction of life-saving devices in coal mines, but which failed to pass. Such devices have been installed in Cape Breton mines on the sole initiative of the coal owners without assistance or recognition from the Government. In Nova Scotia we make the reasonable boast that our mining laws are adequate and that they are properly enforced; further, even in the face of the large influx of foreign labour that has come to Canada in recent years, the great majority of the Nova Scotian miners are skilled men speaking the English tongue. The fatal accident rate in Nova Scotia coal mines is from two to three per thousand. In 1908 in the United States the figure will not be very far from five per thousand. It is not correct to say that coal mining is the most hazardous industry in America, if America is taken to mean the North American continent. This statement may be true of the United States, and we believe it is, but it is not true of Canada. It is significant that those coal mining Provinces of Canada which have the highest death rate are just those Provinces which have allowed themselves to come under the guidance of the United States labour unions. If the test suggested by the Deputy Minister's report could be applied to the condition of affairs existing in Nova Scotia to-day, the strike would end because the U.M.W.A. would be compelled to return home—there they will find work sufficient to absorb all their energies and all their funds.

Mr. Daniel McDougall, the President of the Nova Scotia District of the U.M.W.A., some time ago published an open letter setting forth the contentions of the men on strike at Glace Bay. He made a strong point of the assumption that the strikers would be content to return to work if the Coal Company would merely consent to receive a committee of employees—thereby implying that the Dominion Coal Company had not been in the habit of receiving committees of their employees, which, as we pointed out at the time, was an entirely baseless implication. Mr. Acland states that the three strikes in Nova Scotia, that is the strike at Glace Bay and those at Inverness and at Springhill, were all called to obtain recognition of the labour organization known as the United Mine Workers of America. There is not now and there never has been any other cause for these strikes, except the straight refusal of the coal operators of Nova Scotia to recognize this foreign union, and it is evident that Mr. Acland has appreciated Mr. McDougall's subterfuges at their true value.

**Ancient History.**—During the past two years the United Mine Workers have monotonously reiterated certain phrases and certain claims. Some of these were as follows: The United Mine Workers came to Nova Scotia at the request of the miners of Nova Scotia, "entirely unsolicited," as the patent medicine advertisement would say. The United Mine Workers regard contracts as sacred things, for which reason they would have carried out the obligations undertaken by the P.W.A. under the Two Years' Contract. The leaders of the U.M.W.A. have again and again stated their dislike for sympathetic strikes, and have—for Canadian consumption only—made light of that clause in the U.M.W.A. Constitution which specifically provides for such strikes, when it is considered they will "conserve the best interests of the U.M.W.A. as a body."

In view of these oft repeated statements some excerpts from the proceedings of the Convention of the U.M.W.A. at the end of 1905 are interesting. That Convention received its impression

of matters in Nova Scotia from a report the nature of which is best illustrated by a few quotations. "At the Grand Council of the Provincial Workmen's Association held in Halifax last September, Charles O. Sherman was given a hearing. . . A movement is on foot to try and get Mr. Sherman to speak at the various centres so that the body of workers will have an opportunity to hear him. The 'safe and sane' men in the P.W.A. are kept busy trying to destroy the growth of the seed planted, but that is impossible." One might call this sort of thing "ground-bait," but it is a little hard on the fish that is hooked to claim that the hook was an "invitation."

The Three Years' Contract is referred to as a "pistol" forced upon an unwilling body of men who could not resist, and the report flouts any wage contract based upon an "identity of interests basis," enunciating the doctrine that "labour is entitled to all it produces." The Three Years' Contract is also attacked because it provides that the employees should not attempt to restrict the sale of coal, which the report remarks "precludes any sympathetic strike." Evidently sympathetic strikes met with the approval of the U.M.W.A. in 1905, and their Constitution is the same to-day. Is not a sympathetic strike, or a union that approves of sympathetic strikes, a conspiracy to restrict the facilities for the mining of coal? The report makes queer reading in face of the prosecution of the coal operators in Nova Scotia by the U.M.W.A. on a charge of conspiracy.

The "invitation" which the miners of Nova Scotia gave to the U.M.W.A. was exhorted by the lavish expenditure of large sums of money. This was quite a natural move on the part of the leaders of the U.M.W.A. It has long been the policy of the heads of that union to control the whole of the great coalfield which occupies the eastern half of this continent, and to consolidate their power throughout the length and breadth of the Appalachian coalfield from Alabama to Cape Breton. This is the policy of the U.M.W.A. Whether it bodes any good to Nova Scotia is for the Nova Scotian to say, and he is saying unmistakably that it does not. It is, however, quite time that the U.M.W.A. threw off the pretence of an "invitation" to Nova Scotia.

The respect of the U.M.W.A. for a brother labour organization is shown by the manner in which they conducted the strike at Inverness, which, as the Deputy Minister of Labour points out, was a "closed shop" of the P.W.A. The sacredness of a contract to the U.M.W.A. is shown by the strike at Glace Bay, which was called, fatuously enough, at a time when the Two Years' Contract had only six months to run, and called also by men who had taken a leading part in the making of that contract.

**Rescue Apparatus for Mines.**—The First Report of the British Royal Commission on Mines, issued in May, 1907, dealt very fully with the use of breathing appliances, and the merits of the different types of apparatus in the present stage of development. In the Second Report the commission has dealt with the organization and ambulance and rescue work, and reviews the experience of the past few days in this regard. The commission report having visited many rescue stations both at home and on the Continent of Europe, where they remark the use of rescue apparatus is becoming general. In Austria their provision is compulsory, and the regulations of the French Government of a similar character became effective at the beginning of this year. In Belgium also the law requires the provision of rescue apparatus. The commission remark: "Our attention has also been drawn to a recent instance in which breathing apparatus was used with success in a colliery in Nova Scotia in dealing with an underground fire. We understand that the establishment of the rescue station of the Dominion Coal Company was due to the occurrence of several underground fires, two of which were so serious as to necessitate the flooding of the pits; and that since the fire at the Sydney mines, the Nova Scotia Steel & Coal Co. has decided on a similar course." The commission expresses its opinion that rescue apparatus is of proved value in case of

underground fires, and that systematic provision of apparatus and for the training of men in its use should be pursued with greater energy. The commission also expresses the opinion that men trained should not be expected to be prepared for a call for their services "outside their district in order to supply the needs of collieries where no provision has been made for such occasions of emergency, and it places an unfair burden of responsibility on those owners who have taken the precaution to have men trained. We do not think any colliery owner should excuse himself on the ground that his mines are not liable to explosion or to fires. . . . Having regard to the experience of recent years, no owners should be rash enough to regard themselves as entirely immune against risk of explosion." In concluding its remarks on the organization of rescue corps, the commission sums up the matter very definitely, as follows: "We have, therefore, come to the conclusion that the provision and use of breathing apparatus should be general throughout the country, and that every mine should either be provided with a properly trained brigade of its own, which appears to us the best arrangement, or have the right to call for a sufficient number of equipped and trained men from a rescue station."

The report makes a strong plea for the combination of the work of the St. John's Ambulance Association with that of training in the use of special devices, and instances several cases where even an elementary knowledge of first aid would have saved life or prevented suffering.

**North Atlantic Collieries, Limited.**—The Dominion Coal Company has sub-let to the North Atlantic Collieries Co., Limited, the successors of the old Gowrie & Blockhouse Company, a strip of territory, passing through a lease of the Coal Company which intervenes between the North Atlantic Company's submarine areas, and the land workings. The North Atlantic Company will now commence to drive tunnels through the sub-leased area, which will take about two years to reach their submarine take. The line of the tunnels will occupy almost exactly the trough of the narrow coal basin which forms the Morien Coalfield. The North Atlantic Company estimate that the submarine area of the Blockhouse Seam, which will be reached by the new tunnel, contains available coal to the extent of 56,000,000 tons. The Blockhouse Seam is generally considered as the equivalent of the Hub Seam in the Glace Bay Basin, and of the Barachois in the Lingan Basin, but there is considerable doubt about the proper correlation of the Glace Bay and the Morien Basins. This extensive exploration which is projected by the North Atlantic Collieries Company will doubtless afford interesting data in this connection.

## ONTARIO.

**Cobalt, Dec. 4.**—The first consignment of ore to be sent out of the South Coleman district, except from the Temiscaming, was recently shipped from the Beaver mine. This ore is from the vein discovered some months ago, which is still being worked and continues to show good values.

Several of the Gillies Limit lots acquired in the recent sale are now being actively worked. Among these is A 54, for which was paid the second highest price of any of the properties. It is stated that the owners of lot A 91 are prepared to spend fifty thousand dollars in developing their holdings. This property is one on which a three-inch vein was found. Some time ago a small shaft was sunk to a depth of about twenty-five feet, but the silver values were very low. Favourable results have also attended the work being done on A 48 and A 53. Good veins have been located and traced for a considerable distance.

Considerable uneasiness has been felt lately among the mine managers of this district on account of the T. & N. O. Ry. threatening to place an embargo on freight billed for Cobalt. The congested condition of the traffic between Cobalt and

North Bay has improved very little, and many of the mines have suffered on account of the lack of fuel. The railway claims that the cars are not unloaded as fast as they should be, and as a consequence the yard is always full of freight, much of which it is impossible to get at. The railway commission threatened to place an embargo on freight if this condition was not improved. A great part of this congestion is due, however, to the lack of system in the freight office here, and the inability of the T. & N. O. to handle matters in a businesslike manner. Several of the mines have at one time or another had to shut down for lack of coal, so that the question has assumed rather serious proportions.

The interest in the gold discoveries in the Porcupine Lake district continues to increase, and it is probable that when once the cold weather sets in there will be a considerable rush into this section. So far, however, no work of any consequence has been done and it is impossible to determine the value of these discoveries. There is a considerable feeling that this section will turn out to be a replica of Larder Lake, and there are bound to be many disappointments.

In sinking the shaft on the Wyandoh property, at one hundred feet from the Waldman boundary, and on the continuation of the Waldman vein, good ore was encountered at a depth of nine feet. The shaft was started on the barren end of the vein, but now they have about three inches of smaltite ore with good values in silver. The point at which this silver was encountered is about one hundred feet from where the good showing was found on the surface.

The T. & N. O. Railway is planning for heavy traffic between Charlton and Gowganda during the coming winter, and is making extensive preparations to handle the large amounts of freight expected. New freight sheds and sidings have been constructed, and conditions should be very much better than last year. It is understood that the company has decided to bill goods through to Gowganda, and it is the intention of the road to make arrangements for teams at Charlton to take the freight in from the railway, and negotiations are now under way for the hire of a large number of teams for this purpose. Increased competition and much better roads will serve to bring about a very substantial reduction in the rates that were in force a year ago.

The physical condition of the Cobalt Lake Co. has been steadily improving the last few months. The new vein that was discovered a short time ago has been showing up well under development, and carries a number of stringers of high grade ore. Between the walls there is thirty inches of mineralized area, and in this are three stringers. Assays taken from these stringers have gone over four thousand ounces to the ton.

The recent report circulated about the condition of the Crown Reserve Mine has created a good deal of excitement in various circles outside of Cobalt. There is no truth in these rumours that the mine was flooded, and the management has taken every precaution to avoid such a contingency. The shaft is at present down 200 feet, and drifts have been run on the vein at the 100 feet and 200 feet levels, and connected with a raise over 200 feet from the shaft. The block of ore between the 100 ft. and 200 ft. level, is in good ore, and has scarcely been attacked. The upper level has been stoped out as far as it was reasonably safe to do so, though the management has been very conservative, and allowed a safe margin in discontinuing stoping in this upper level. These remarks apply to the main or Carson vein, but the company also has reserves in the shape of a considerable number of veins, which while they have not the spectacular values of the main vein, nor are they so large, will, when opened up, add materially to this property's reserves.

The Wetlaufer Mine in South Lorraine has shipped another car of high grade ore, and it is understood that two more will be shipped in the near future. All this ore is from development work in sinking the shaft, and drifting on the 140-ft. level.

It is expected that the annual meeting of the Cobalt Central,

which is to be held shortly, will be very stormy. It has been decided by the representatives of the committee that is investigating the affairs of this company to take further action. This is in regard to certain loans which it is stated have been made to the company, and which have not appeared in the financial reports. The Cobalt Central has always come in for a good deal of criticism, on account of the very indefinite statements that have been issued, and it is stated that there has never yet been a complete financial report issued to the shareholders.

The continuation of the mining operations of the Colonial Mine has resulted in the discovery of two new veins. One of these is about 2½ in. in width of cobalt and considerable native silver. The wall rock is also well mineralized for about two feet on each side of the vein, which promises a large amount of milling ore. The main work now being done is in the No. 2 tunnel above Cross Lake, and this is now being connected with No. 2 tunnel. It has been decided to add a tube mill to the equipment of the concentrator. This mill is being operated by electric power from Hound Chutes.

It is expected that the government road from Elk Lake to Gowganda will be completed about the middle of December. This road is in good shape with a very low gradient, and will assist very materially in cutting down the price of supplies going into the country. This winter there will be three roads into that section, one via the C.P.R. and Bisoo, the end of the steel of the Canadian Northern, and the T. & N. O. at Charlton. The former is rather too long to be seriously considered in competition with the other routes, which, as far as distance from the end of the steel to Gowganda is concerned, are about equal.

Considerable progress has been made at the Nancy Helen since the new ore bodies were discovered on the 60-foot level some time ago. Recently in a cross-cut about 80 feet from the Buffalo line a rich stringer about one inch in width was encountered. It is believed that within a couple of weeks another shipment of high-grade ore will be available. At present practically all the work in the mine is being done at the 60-foot level. In the vein that is running towards the City of Cobalt line, about 150 feet has been developed by a drift, and the face of the drift is still about 300 feet from the line. This vein shows a good width of high-grade ore.

After sinking the shaft on the Silver Cross to a depth of 125 feet, diabase has been encountered below this point. It is a very important matter for the company, and will have considerable bearing on the future development of the property. The shaft was started on a cobalt vein carrying practically no values in silver. After the diabase was encountered the vein was much stronger and better defined, and carried higher values in silver.

Another vein of high-grade ore has been cut at the 75-foot level of the Right-of-Way in a cross-cut about fifty feet from the shaft. At the No. 3 shaft, which is between the Silver Queen and McKinley-Darragh, four veins showing high-grade ore are now being worked. This shaft is 95 feet deep, and at the 75 foot level a cross-cut has been run north and south. South 210 feet, and in the north 900 feet. In this latter cross-cut three veins carrying high-grade ore were struck.

The annual report of the Coniagas Mines has just been issued. In addition to the usual statement of ore reserves and work done during the year it also gives a map showing the veins and the amount of stoping and development work done during the year. The ore reserves on October 31st were estimated at 12,500,000 ounces, contained in the following:—

|                                               |           |
|-----------------------------------------------|-----------|
| Vein matter, 3,427 tons—ounces silver .....   | 9,125,500 |
| Milling rock, 103,000 tons—ounces silver..... | 3,432,200 |

---

12,557,700

This estimate does not take into account the opening up of a new level in which considerable ore has been found. This level

is being run to connect with the shaft sunk near the south-east corner of the property in the centre of the town. During the year an average force of 118 men was worked. The work done for the year is as follows:—

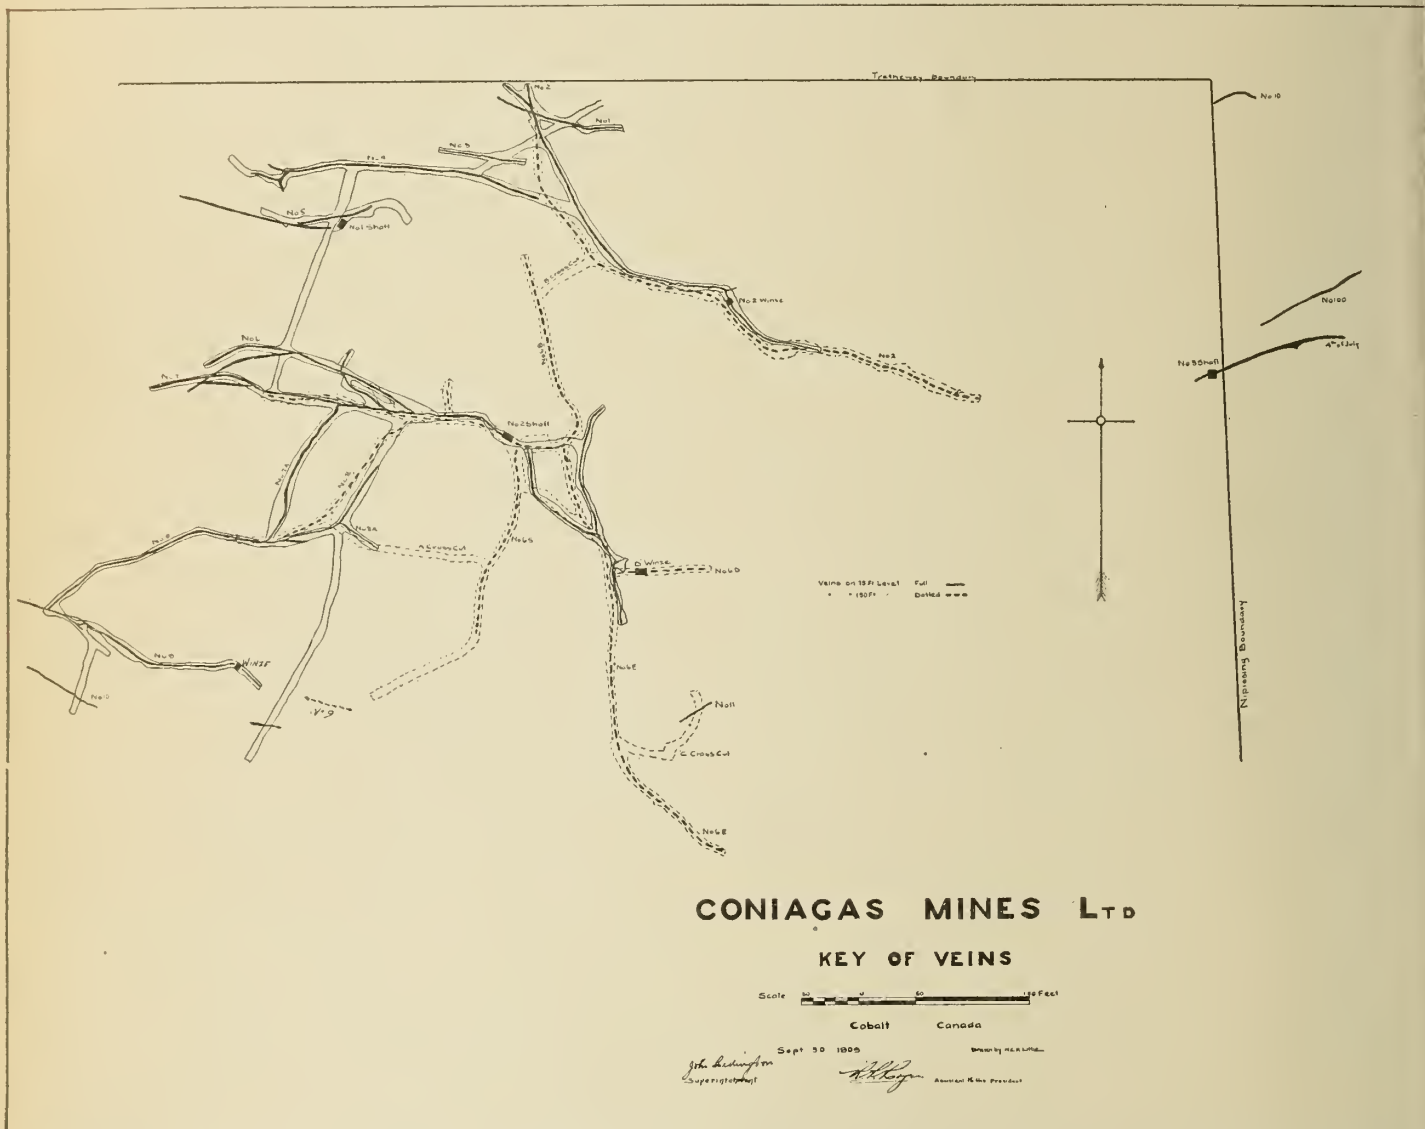

|                         |            |
|-------------------------|------------|
| Shaft sinking .....     | 51 feet    |
| Drifting .....          | 1,254 feet |
| Cross-cutting .....     | 1,254 feet |
| Winzes and Raises ..... | 80 feet    |

In regard to the Coniagas Reduction Company at Thorold, the report states that in order to take up part of the floating debt of the subsidiary company that was formed to take over the smelter, and to provide further working capital, the directors decided to take up 1,494 more shares of stock at par. The finan-

There has been considerable improvement in the prospects of the Lawson property during the past few weeks. From the main drift on the "Silver Sidewalk" a cross-cut has been run to No. 5 vein, and some drifting has been done. At this depth there is considerable showing of high grade ore. A crosscut was run at the 88-foot level.

**Kenora Mining Division.**—The latest advices from Gold Rock report that the Swede Boy or Mining Location H.P. 259, on upper Manitou Lake, is to be put on a paying basis almost at once, in fact a small stamp mill has already been placed in position on the ground and as the property shows evidences of being a rich one we expect to hear shortly of good returns.

One of the healthiest signs of this district is the fact that

cial report shows a balance of \$140,014. During the year three dividends amounting to \$360,000 were paid. The experiments that have been conducted with the Redington drill, which was invented by Mr. Redington, superintendent of the property, have been successful, and the Coniagas Company has acquired 55% interest in it.

During the month of November there were shipped from Cobalt 32 cars of high grade ore, 7 cars of medium and 37 cars of low grade ore, aggregating 4,959,651 lbs. Total shipments for the first eleven months of the year 1909 amounted to 28,075 tons.

Underground work has again been started on the Red Rock and Green Meehan. Both these properties are now being operated by the same company, known as the Cobalt Consolidated Silver Mining Co.

local capital is being invested in the properties here which tends to show that the properties are bona fide mineral claims and good ones too in the belief of the residents.

The Northern Development Co. has now got its 10 stamp mill completed and is working double shifts. Their new boiler house is completed and the boilers installed. The shaft house has been enlarged and a tramway built between the shaft house and the mill, and taken altogether everything looks to be shipshape and ready for a steady run of good work. A contract has been let for 1,800 cords of wood.

The Laurentian has been shut down after running out what ore was in the bins and awaits the results of the legal proceedings now progressing. It is however confidently expected that the mine will be in full swing again by Dec. 15th.

In the Detola Company's mine has been built a new blacksmith shop. The shaft house has been boarded in and everything made snug for the winter. The old blacksmith shop has been made over into a comfortable and commodious dryhouse for the miners. The shaft is now down below the 200 foot level and it is the intention of the management to sink to the 250 foot level before cross-cutting; when this level is reached they intend to drift along several different veins which they have cut and have already laid out cross-cutting amounting to 700 feet.

The master mechanic is now on the ground at the Minnehaha property, near Beandro's Landing, waiting till the lakes freeze up so he can get in the new plant which is to be installed this winter.

**Historical.**—The Kenora Mining Division of which to-day there is little heard was once and will be again one of the foremost gold fields of Canada.

The seeming lack of interest in this field at present is, in my opinion, due entirely to bad management, gold stealing by miners, and last, but by no means least, "wild-catting" of the most deliberate and cold-blooded description.

In 1900 there were operating in this district the following mines, not merely prospects staked out and held, but bona fide mines:—

| Mine.                    | No. of Stamps. | Weight of Stamps. |
|--------------------------|----------------|-------------------|
| Mikado .....             | 20             | 850 lbs.          |
| Sultana .....            | 30             | 850 "             |
| Olive .....              | 10             | 850 "             |
| Regina .....             | 8              | ...               |
| Big Master .....         | 10             | 1,050 "           |
| Sakoose .....            | 2              | 850 "             |
| Decca .....              | 10             | 850 "             |
| Olive .....              | 15             | 900 "             |
| Independence .....       | 10             | 850 "             |
| El Delora .....          | 2              | 950 "             |
| Lake Harold .....        | 5              | 850 "             |
| Headlight .....          | 2              | 1,050 "           |
| Lucky Coon .....         | 5              | 850 "             |
| Alice A .....            | 2              | 850 "             |
| Golden Winner .....      | 5              | 900 "             |
| Minnetakie .....         | 10             | 900 "             |
| Haycock .....            | 2              | 850 "             |
| Shores .....             | 2              | 950 "             |
| Rainy River Develop. Co. | 1              | 1,250 "           |
| Foley .....              | 20             | 750 "             |
| Empress .....            | 10             | 950 "             |
| Golden Star .....        | 10             | 1,020 "           |
| Hammond Reef .....       | 40             | 900 "             |
| Crown Point .....        | 5              | 850 "             |
| Gold Panner .....        | 10             | 950 "             |
| Glass Reef .....         | 10             | 1,000 "           |
| Sawbill .....            | 10             | 850 "             |
| Combine .....            | 10             | 850 "             |

These mines all give from assays, made by reputable people and firms, values warranting development work; and many gave promise of surpassing even the hopes of their owners. To-day, except for some six or eight, these mines are not being worked and their plants are lying idle, in some cases being looked after by caretakers. In many cases, however, the machinery is rusted and useless, not because the properties are valueless but because the shareholders never got the consideration, or even the smallest chance at a fair, honest deal that should have been theirs. To take the causes of trouble in their order and to show that laying the blame on these conditions previously mentioned is not a mere fancy, it can be pointed out that men were placed in charge of mines in this district who were not fitted, either from point of education or practical experience to fulfil positions one tenth as exacting. Before a mining property had been duly tested, either by sinking, drifting, cross-cutting or even diamond drilling, the inexperienced, ignorant or wilfully dishonest man

in charge would send away his order for expensive mill machinery, often times ordering a class of machinery so totally unsuited to the needs of the particular property in question as to be absolutely useless.

Men have been put on as mine captains whose only claim to the position was having married somebody's wife's sister's cousin, and who had so small a conception of what was meant by a shift's work that they never knew what to expect from the men in regard to a fair equivalent value of work done for the moneys expended by the employers.

Apart from this matter of not getting for the absent shareholders a decent return in work done for their investment, how could men so magnificently ignorant of even the fundamentals of mining direct to the best advantage what little work they might manage to coax from their amused miners? Their lack of knowledge is apparent to-day in many of the mines; but without raising hostility and heart burnings it would be impossible to give names either of people, mines, or places. So, knowing that anyone really interested can to-day get for his own benefit data to prove every statement here given, we will leave this phase of the subject and go on to the second, that of gold stealing.

To-day, in the town of Kenora, with any group of say 10 men, if gold mines or properties be the topic of conversation, it is almost certain that one member of the group will hold out his hand to show a gold ring, or his cuffs to show his cuff buttons, remarking, "These are some of the —gold; boys, she must have been rich!" Many of the blacksmiths will tell of smashing up quartz with their hammers and putting it in an iron spoon in their forges to get a button for so and so, so that he could get a ring made from the "specimens" he brought to town from such and such a mine. One man bought an overcoat from a local tailor and paid for it in specimens he had brought in from the mine. The tailor got \$200 for the gold taken from these specimens. This man, asked if he had no compunctions about taking these specimens, said: "Say, one night I was out of my bunk and I saw two men moving away round an out-house over the snow. I sneaked after them quietly. They went up into the loft of a stable, and I got a good look at them from where I lay hid in this stable as they came down. They were the mine captain and the storekeeper. When they had gone I felt sort of curious as to what had taken them up there, so went to find out. I found under the hay a sack full of specimens, and those I looked at were more gold than quartz, for we were then in the very richest part of the vein. I thought I had as good a right as they had to those specimens, so I took the sack and carried it into the bush and buried it in the snow, covering my tracks as best I could. Next day I went down to get it but the bag had gone; someone had followed me, and though I did my best to find what had happened to them I never ran across those specimens again. Now, if the shift bosses and mine captain could take the stuff like that, why shouldn't I?"

This is only one case—there are many others.

I have it on reliable authority that a miner was showing a friend a sample of gold containing a one ounce nugget on the main street of Kenora. The manager of the mine came past and recognized the sample as being from his mine. He asked to see it, looked it over and asked if it had not come from such and such a mine. The miner said "Yes." So the manager put the specimen in his pocket, asserting that as a representative of the company it was up to him to keep it. The miner, however, ordered him to give it back, threatening if he did not to expose him for stealing gold from the same mine! And these were the men sent to this district by the shareholders to safeguard their interests! Men who in most cases were well and even liberally paid and whose receipt of their salary was, on account of their ignorance and lack of technical education, almost a steal!

To go now to the last case, that of wild-catting, I am not going to mention the ordinary everyday scheme of taking

samples from one claim and placing them on another; and then taking the prospective purchaser to view this carefully salted vein. That of course has been done here and perhaps in no case more daringly than that of the would-be tin mine, where the dishonest promoters were convicted of having loaded the face with tin ore. Conviction was easy, for not only was it the fact that such rock had never before been known to contain tin ore, but also, in spite of the risks they were running, the men were too lazy to destroy the barrels in which the ore had been shipped to them. Many readers of this paper will doubtless remember the circumstances accompanying this scandalous transaction. This is not, however, the type of wild-catting I refer to. I have reference to the kind that causes men to sink a pit in barren rock where there never was nor could be any sign of auriferous ore, simply that the partner or the stock market may escape criminal proceedings for trying to sell stock in a mine that never existed.

In one case an old miner who had some remnant of a conscience left approached the manager to try and convince him of the futility of working further in the barren country rock and was told he was paid good wages to hold his tongue. In another case, after working for months in barren rock, a company that had sold much stock to the public and had never had even a quartz vein on which to sink, set a diamond driller to work on a small stringer some 500 yards away from the main shaft. The driller came into camp one night and whispered to the miners that they had struck it rich with the drill on the stringer at 100 feet and gave dimensions of the vein cut by the drill and its approximate richness. The miners bit, and spent all the wages coming to them for shares in the mine. The manager wired his directors that the miners themselves believed so heartily in the mine that they were buying shares. Stock rose, and within six months the mine closed down. The diamond drillers had misled the miners. It is this wild-catting that has been so disastrous. In this regard we must in fairness report at least one case of which we know, in which the manager of a mine resigned his position rather than falsify his reports as ordered by those who were placing the stock on the market.

Since all these facts are being gradually assimilated by the public, and even the unfairly treated shareholders are beginning to see that the blame should be laid upon the individual and not on the property, this district is experiencing a gradual return of public interest, and before long we may again see the whole district busy and work resumed upon the many valuable properties now lying idle with that idleness that is a lasting record of the evil of deliberate dishonesty.

#### BRITISH COLUMBIA.

**Roseland.**—The shipments of ore from this camp still continue to average about 5,000 tons per week, the Centre Star, Le Roi and Le Roi 2, Ltd., shipping and the concentrator at the Le Roi 2, Ltd. treating 260 tons of "second-class" ore per week. The lessee of the Velvet-Portland property shipped 35 tons of ore from the dump during the past week, which will give smelter returns of about \$32 per ton. Work is being prosecuted on the Velvet property with a view to shipping steadily as soon as the snow roads get in good condition.

The shaft on the Josie property of the Le Roi 2, Ltd. is now down below the 1,250 level and nearing the 1,300-ft. level. The company is stoping and shipping from five to seven hundred tons per week to Trail smelter.

Two diamond drills are at work in the Le Roi and considerable drifting and stoping is being done, and occasional shipments made as ore accumulates.

The usual steady progress is noticeable about the Centre Star group of the Consolidated Co. Shipments are averaging 4,300-4,500 tons per week of average grade ore. The claims lately acquired are being opened from the lower workings of the

Centre Star and War Eagle mines, while considerable diamond drill work is being done, on the surface as well as from the underground workings. At the Trail smelter this company, in addition to custom ore, is receiving approximately 4,500 tons per week from its Snowshoe mine at Phoenix, 300 to 450 tons per week from the St. Eugene and occasional shipments of \$42 product from the Richmond-Eureka. The returns from the Trail smelter for the month of October amounted to \$412,865. While this is not as high a figure, by any means, as prevailed in July and August, still if it is maintained to the end of the present calendar year it will carry the total figure for the smelter over the \$6,000,000 mark, which will be close to a million dollars greater than any previous year in the history of the plant. Of course this is a natural consequence where an industry is progressing and enlarging. This works is now turning out silver .999 fine, fine gold, base bullion, copper matte, pig lead, lead pipe, bluestone and electrolytic bearing metal.

The buildings and foundations are being hurried along at the Fife mines, to accommodate the 100-h.p. boiler and air compressing plant when it arrives. As soon as this mining plant is working the management intends to open the property on a larger scale than it has been worked hitherto.

**Boundary.**—It looks as though the men behind the billion dollar copper combine had not overlooked the Boundary district in making their calculations toward controlling the copper output of this continent. It is rumoured that the Granby Consolidated Mining, Smelting and Power Co. will very likely be absorbed if the deal is consummated. If the Granby Co. is acquired there is no doubt that the British Columbia Copper Co., which now controls the New Dominion, will also be taken in. As it is, this property is controlled by New York capitalists, many of whom are closely allied with the men connected with the proposed copper combine. It does not seem reasonable to think that the men arranging the merger could afford to overlook a copper-gold producing district that is now putting 30,000,000 to 35,000,000 lbs. copper annually on the market and which under normally favourable conditions, with the B.C. Copper Co. and Granby working steadily, could possibly double this output.

Former State Geologist of Minnesota, H. V. Winchell, now connected with the Guggenheims, is in the West examining various copper mines and it is said that he is headed for the Boundary where in particular he will look over the Granby property. It is not likely that the merger crowd will show their cards until they have matters well in hand, so that all the outsiders can do until that time will be to keep guessing. Even if the Granby were included in the merger it might not benefit this district any, for in the course of curtailing the copper output work might be cut down at the local mines. The merger is a big game in which someone is going to be damaged. If the price of the red metal is controlled by any other means than the law of demand and supply then it is very likely that someone may have to pay the piper. But we will know more about this phase of the situation later on.

The Granby mines touched still another high mark when 30,577 tons were shipped for the week ending Nov. 13th. At this rate Granby shipments will run over the million ton figure by the end of the year, but will not exceed the shipments of last year by very much. Despite several months' shut-down, the B.C. Copper Co. will exceed last year's shipments, while the Snowshoe will ship 100,000 tons more this year than in 1908.

It is hoped by local people interested that the Granby directors while in convention on December 7th, will see their way clear to declare a dividend. It is understood the company is in a good position to do this and that it merely rests with the directorate.

The Granby Company, the B.C. Copper Co., the Le Roi Mining Co., and the Con. Mining and Smelting Co. of Canada, Ltd., have all had engineers working in the new mining camps on the Coast

and in the northern part of British Columbia this season. The districts visited included Valdez Island, Queen Charlotte Islands, Portland Canal, and the several districts within a radius of 100 miles of Hazelton on the Skeena River. The prospects in these districts are reported as being favourable, but it remains, of course for greater development to prove the value of the ore bodies at depth and to determine their permanency.

It is stated that the B.C. Copper Co. earned a net profit of \$38,000 during the month of October and produced and sold its copper at 8.8c. per lb. It is pleasing, of course, to see the Boundary mines touching these low cost figures, but conditions in this district are not yet ripe enough for the maintenance of this low cost the year 'round. It is stated that the Granby Co. could produce copper at 5c. per lb. if the future of the mine was not kept in mind; that is, if the management neglected development and only worked on getting out and smelting the ore. So it can be seen that the average figure for a year must be taken as a criterion.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Sydney, N.S.**—No official announcement has been as yet made as to who will direct the destinies of the new steel-coal merger, though it was generally expected that after the meeting of the local officials, held here on Nov. 27th, some definite announcement would be made.

When seen, Mr. Plummer had nothing to say in connection with the business of the companies, or who the new general manager to succeed Mr. Jones would be, but intimated that an announcement would probably be made within a short time.

Mr. Plummer left for Montreal, where there will be a meeting of the directors.

In a circular addressed to the heads of the departments at the plant, Mr. Plummer assured them their relations with the company and their respective positions and work with those now or hereafter in charge at Sydney and among themselves, were all matters of intimate personal concern to himself, and he added that no official need feel that the departure of Mr. Jones affects the security and comfort, or emoluments of his own position.

On the sailing of the steamer Fornebo, which left International Pier on Nov. 27th with a full cargo of coal for Quebec, the Dominion Coal Company shipments up the St. Lawrence were completed for the season. The total shipments amount to 960,000 tons approximately. The shipments for 1908 were 1,344,200 tons, the decrease being due to the strike.

The steamers Christian Knudsen and Borgestad completed their charters with the Coal Company last week, and several others will finish before the end of this week. The company has had eleven chartered steamers this season, besides their regular steamers of the Black Diamond Line. Last season the company only had two chartered boats in the Louisburg-Boston trade, but two more will be added, making a total of four steamers, besides its own regular fleet. Shipping will be continued for the winter months from Louisburg.

### ONTARIO.

**Toronto.**—At Osgoode Hall, Toronto, before Chief Justice Falconbridge, in the non-Jury Sittings last week, John H. Casler, of Los Angeles, Cal., began an action against Messrs. Geo. J. Blake, Adam Witzel, Wm. J. Cusher, and John F. Vogt, directors of the Grace Mining Company, the properties of which are situa-

**East Kootenay.**—The coal measures of the South Fork of Old Man River, is said, give nearly as much promise as did those of the Crow's Nest Pass district in early days. As there are two trans-continental railways hurrying toward this section it will be opened to the surrounding market in the near future. An important strike has been made on the property of the Carbon Hill Coal Co. in this district. As there are indications of oil, that promise well, prospecting is being done in this direction. The Chicago-Alberta Oil Co. is erecting a drilling plant about seven miles from the summit.

A well-known mining man, A. Gowing, was in the Lardeau within the last few weeks looking after personal interests there. He has lately been operating in the Queen Charlotte Islands, where he has staked 17 claims near Tasso Harbour. The ledge, which carries from 6% to 17% copper, \$1 gold and \$3 silver per ton, is nearly 360 feet wide where opened up and can be traced for several thousand feet. The group has been bonded to eastern capitalists at \$400,000.

ted on Eagle Lake, in the Rainy River district. The plaintiff seeks to recover \$12,000, the amount of a mortgage on the properties. Mr. Casler claims the lands, comprising twelve parcels, have not been paid for. The defendants have entered a counter claim for \$150,000 against Casler for alleged fraud and misrepresentation.

The defendants, all of whom are Buffalo people, claim that while the plaintiff was a director of the company he induced the other directors to give him the mortgage, which, they say, was not executed under the authority of a properly called meeting of the directors.

The plaintiff's evidence engaged the Court for half a day. Mr. Casler, in cross examination, denied that he had ever told his assistant that he would keep those Dutchmen in Buffalo busy raising money, and that he could sink it just as fast.

A former secretary-treasurer of the company said he thought none of the directors knew anything about mines. Before Mr. Casler became president of the company he was in the plumbing line.

According to the evidence of Wm. Richards, a mining engineer, foreman for the company, the plaintiff, while manager of the company misled the directors as to the values of the property. He was in the habit of pouring gold dust on the ore matter while demonstrating its value by means of the panning process. As regards the amount of work done by Casler, the witness said he spent most of the time in the office reading his bible or sailing around in a motor boat. Similar evidence was denied by Casler when cross examined by the counsel for the defence on the first day of the trial.

**Kenora.**—Pending the outcome of legal proceedings now in progress, active mining operations at the Laurentian mine have ceased. The official referee at Toronto is calling for tenders for the assets of the Imperial Mines Co., including the buildings, plant, machinery and supplies. The superintendent of the mine, R. B. Nickerson, who paid a brief visit to Kenora last week, has departed for his home in California, accompanied by his father.

On Saturday last Jas. Sherman arrived at Dinorwic from Kenora, en route to the Manitou, where he has been engaged for the past three months erecting the ten-stamp mill at the Paymaster mine. The mill is now in full commission, reducing the extensive ore dump which has accumulated, into bullion. No record of the result of the mill's performance up to date is available as yet, but it is understood that the percentage of gold is quite satisfactory to the management.

**Cobalt.**—The new addition to the McKinley-Darragh concentrator is nearing completion and will have a capacity of 120 tons daily. On the Savage claim belonging to this company another mill of smaller capacity will be erected, probably treating twenty-five tons per day. In addition to this the high grade production is considerable.

### ALBERTA.

**Frank, Nov. 26.**—Andrew Laidlaw, of Spokane, president of the Galbraith Coal Co. of Lundbreck, this province, has brought before the Railway Commission the charge of gross discrimination against the mines of this district in the new coal and coke tariff of the C.P.R., which became effective on October 4th.

Mr. Laidlaw found the new tariff so to discriminate against the product of his mine, placing his company at so serious a disadvantage in the domestic coal market, that he caused complaint to be laid before the Railway Commission, and a hearing on the complaint was had at Regina a few days ago.

The Galbraith Company complained that in the new tariff as compared with the old one, there is a discrimination against the mines of The Pass in favour of Lethbridge, and specified that in the rates from Lundbreck and Pass points to 147 points named, there is an increase of from five to fifteen cents a ton; to 20 points the rates remain the same, while in a few instances there is a slight reduction.

It was shown that from Lethbridge to all points, except in a few instances where the rates remain the same, there was a general reduction running from 25 to 40 cents a ton. For example, from Lundbreck to Regina, there was a reduction of five cents a ton, while from Lethbridge the reduction was 30 cents, thus making a considerable increase in the differential in favour of Lethbridge, which formerly had been but 15 cents.

Other specifications show that the rate from Lethbridge to Cranbrook is \$2.30 for 204 miles, while from Lundbreck to Cranbrook the rate is \$2.25 for 127.7 miles, and that west of Cranbrook the rate is the same from both places.

Other specifications show that the rates from Lundbreck and Pass points to points south on the Alberta Railway and Irrigation Line, the road running from Lethbridge to Great Falls, now owned by the C.P.R., are greatly out of proportion, as, for instance, from Lundbreck to Raymond the rate \$1.60, while to Magrath, less than ten miles distant, the rate is \$2.30.

## MINING NEWS OF THE WORLD.

### GREAT BRITAIN.

The Central Zinc Company's plant at Seaton Carew, West Hartlepool, has a smelting capacity of about 35,000 tons of zinc blende per annum, which should produce about 10,000 tons of spelter. This company is a subsidiary of the Sulphide Corporation, formed to treat the Broken Hill Central mine's zinc blende. It was formed in 1906, since which time extensive experiments have been carried on prior to the starting of the plant at West Carew in May, 1908. The distillation furnaces are of the recuperative type. The pottery is 315 feet long, the upper floor of which is constructed of reinforced concrete. The roasting furnace is steel-panelled, 105 feet long by 75 feet wide, and the distillation works are 415 feet long by 56 feet wide. All the latest developments for zinc blende treatment have been adopted.

At a meeting of the Cardiff Chamber of Commerce on Nov. 24th, Mr. Griffiths (President) said there was a decrease in shipments at the South Wales ports last month of 250,000 tons. He attributed this to decreased output consequent upon the Eight Hours Act. Other speakers who are connected with the collieries

**BRITISH COLUMBIA.**

**Sheep Creek.**—One of this Province's wealthiest mineral districts is the Sheep Creek Valley. Development work has been carried out during the past summer to a very large extent, as well as a large amount of exportation of the ore. Mr. W. G. Burnham, who has been inspecting that district and the properties opened up, arrived in the city the other day, and in an interview gave a long and very interesting resume of the work done.

From the Queen, in all some \$600,000 has been exported. A 20-stamp mill has been set up, and the property is showing up remarkably well. It has been tunnelled for some 500 feet. It was purchased a couple of years ago by a Wisconsin syndicate for \$175,000.

Second in importance is the Mother Lode, a property recently purchased for \$150,000 by Mr. John MacMartin, of Cobalt. Development work has occupied all the time of the owners, and some \$500,000 worth of ore has been exposed. The lower tunnel taps a rich vein of from three to five feet with an excellent showing. In addition to this extensive work, new offices and bunk-houses have been erected; a new trail has been constructed and a two-mile road built to a location where a mill will be constructed shortly.

The Nugget claim is the next most highly developed property. For the past twelve months a four-stamp mill has been in operation, turning out from \$8,000 to \$10,000 monthly entirely from the stoping. Four levels have been opened for some 500 feet. In the lower tunnel a three and a half foot high grade milling ore has been uncovered, which runs from \$40 to \$90. There is half a million dollars worth of ore in sight alone, and when exportation begins, it is expected that the claim will be one of the richest in the district.

The Golden Fawn property has two parallel veins to the Nugget claim. It is only in the early stages of development, but the surface outcroppings show from \$83 to \$225. Two tunnels are being excavated, and a paystreak has been unearthed in the centre for some 20 feet, assaying at \$185 to \$225. The property is being controlled and managed by Vancouver people and has started with a better showing than the others.

The Bonanza claim is another wealthy property, and was taken over last week for \$75,000 by a Vancouver syndicate.

stated the output had decreased from 10 to 15 per cent. since the new Act came into operation, and this despite the fact that more miners were now employed in pits.

### SOUTH AFRICA.

**Johannesburg.**—At the meeting of the Transvaal Chamber of Mines on Nov. 17th, Mr. Reyersbach made reassuring statements as to the native labour position. The present shortage gave no reason for anxiety. The speech has made an excellent impression.

Definite arrangements have been come to with the Government on the bewaarplaatsen question. The companies entitled to the ground will receive a fixed allowance of 2s 6d per ton treated, plus 25 per cent. of the net profits. No allowance is to be made for capital expenditure.

Development work for October on the Van Ryn Deep proved a record, 361 ft. having been driven on the eastern extension. Assays give 9 dwts. over 36 ins. for 50 ft. of driving from the shaft.

Upon technical advice, the Midas Deep is to shut down the mine and mill, but operations will be continued upon the treatment of slimes.

Mr. Webber, acting as chairman at a meeting of the Transvaal Chamber of Mines, made a speech in which he bade farewell and paid a tribute to Mr. Reyersbach, who is taking up a partnership in London in the firm of Wernher Beit & Co.

Mr. Reyersbach referred to the general situation on the Rand. He admitted that there was a shortage of native labour for the mines at present, but thought there was no cause for anxiety. All the colonies under the Union would be bound to take the utmost interest in the mines. He announced that an equitable settlement had been practically arrived at with the Government on the bewaarplaatsen question on a sliding scale basis. He urged the discontinuance of the monthly reports of output, labour supply, working costs, etc., suggesting that yearly reports would be sufficient and, indeed, the more advantageous.

#### AFRICA.

##### Nigeria.

With the recent revival of interest in West African gold mining, the other mineral resources of the country are evidently not to be neglected. It has been announced that the Champion Gold Reefs of West Africa has abandoned its option on a gold area in Apollonia, and has taken up tin mining in Nigeria. Now, the Nigerian Tin Corporation has been formed with a capital of £100,000, "to acquire and develop alluvial tin areas in Northern Nigeria, and, as suitable opportunities may offer, to co-operate with existing or future organizations in the same field." The frank admission that the Corporation has at present no properties, nor even options on any, disarms criticism.

##### Egypt.

There is every indication of growing activity in the oil industry in Egypt. The most recent company to make its appearance is the Helouan Petroleum Company. The capital is £60,000, in £1 shares, of which £20,000 is set aside for working capital, and the objects of the concern are stated to be the developing and dealing with petroleum and other mineral rights in Egypt and the Soudan, the Red Sea Littoral and Sinia Peninsula, and elsewhere in Northern Africa. A prospecting license has been granted by the Egyptian Government over an extensive area to the south-east of Helouan, about eighteen miles from Cairo, and already strong indications of petroleum have been discovered. The license is renewable yearly on payment of £25, and royalties are payable to the Government as follows:—6d on every ton of coal, 6d on every hundred gallons of raw oil and 3s on every ton of mineral wax or other substances produced.

#### RUSSIA.

Increasing activity is reported in the Bakn oilfields, and for the first nine months of the year the production reached a total of 367,700,000 poods, as against some 344,440,000 poods for the corresponding period of 1908. During September the output amounted to 43,800,000 poods. This was rather less than in August, a circumstance explained by the fact that the month is a day short.

Active development operations are reported in the oil districts of Southern Russia, the latest to attract attention being Maikop, which lies within easy distance of the Black Sea. Already boreholes have yielded highly encouraging results, and refineries are now being erected and equipment installed.

#### AUSTRALIA.

Sydney, Nov. 24.—Dissensions are reported among the Northern colliery proprietors, due to the alleged previous knowledge by some of them that a strike was coming.

A shipment of 3,000 tons of coal has arrived from Newcastle. The miners' congress has decided to handle it, as it is intended for use on the railways. Another shipment of 6,000 tons for the Fiji Islands has been intercepted at Norfolk Island and recalled.

The Southern miners are restless, and it is rumoured that they desire to break away. A non-unionist has been assaulted in the western district, and two strikers have been arrested.

The Southern proprietors have notified Mr. Lee, the Acting Premier, that they do not agree to the men's proposal for an open conference to discuss the principal questions in dispute. They are, however, willing to refer the dispute to the Wages Board.

#### NEW ZEALAND.

The Minister of Mines, Nov. 24th, declared that since the Greymouth miners' union cancelled its registration under the Arbitration Act he had been endeavouring to arrange a working agreement on this crucial point. He considered that trucking from the surface would involve an extra charge of fourpence per ton, equal to £4,000 on last year's orders. "We could not stand it," said the Minister. "I proposed reference to the Conciliation Commissioner or the Arbitration Court, but the men refused. We cannot see our way to make further concessions."

#### UNITED STATES.

Arizona.—The Miami Copper Company are attempting to enlarge considerably their ore resources by means of diamond drilling. The company owns 260 acres of unproven ground.

Washington.—The gold mines of the United States produced \$94,560,000 worth of the precious metal during 1908, according to the Geological Survey and the Bureau of Mines, which have co-operated in preparing an analysis of the reports from private refineries and Federal mints and assay offices.

The total gold output was 4,574,340 ounces, a net increase in value of \$4,124,300. Colorado led with a productive value of \$22,871,000; Alaska was second with \$19,858,800; and California was third with \$19,329,700.

Porto Rico was the smallest producer with a total of only \$600.

The Philippines show an increase of \$219,800 to a total of \$284,500.

Some States of the Union, usually not associated in the public mind with gold mining, make a showing in the reports. In fact twenty-one of the States and territories, not including Porto Rico and the Philippines, are producing gold. Texas produced \$500 worth in 1908; New Hampshire mined \$3,700 worth, and somewhere in the vast grazing country of Wyoming was produced \$7,600. The summary shows a net decrease of 4,073,900 ounces of silver, with a value of \$28,050,600. The total production was 52,440,800 fine ounces.

Montana leads with a production of 10,356,200 fine ounces.

As in gold, the Philippines show a remarkable increase in silver production. From 100 ounces in 1907, the production of the islands jumped to 1,300,000 in 1908.

A new safety lamp for miners has the lamp bulb enclosed in a large air-tight glass globe, and the heat of the light expands the enclosed air, creating considerable pressure. If the bulb is broken in any accident, the compressed air rushes in and extinguishes and cools the incandescent filament before the explosive air of the mine can reach it. A single-cell storage battery, enclosed in a celluloid case, supplies current for twelve hours on a single charge, yielding a light of between one and two candle power.

# STATISTICS AND RETURNS

## COBALT ORE SHIPMENTS.

Shipments of ore from the Cobalt camp last week consisted of 1,189,157 pounds of ore, divided among nine mines, which included the usual leading shippers and the first shipment from the Beaver.

Shipments from the camp for the year to date total 26,917 tons. Shipments for week and year to date in pounds of ore are:—

|                        | Week ending<br>Nov. 27. | Year to date. |
|------------------------|-------------------------|---------------|
| Beaver .....           | 50,000                  | 50,000        |
| Buffalo .....          |                         | 988,891       |
| Chambers-Ferland ..... |                         | 961,110       |
| City of Cobalt .....   | 41,325                  | 1,141,447     |

## ASBESTOS.

The Amalgamated Asbestos Corporation has issued its statement of operations for the five months ending October 31st.

## TORONTO MARKETS.

### Metals.

Dec. 8.—(Quotations from Canada Metal Co., Toronto.)  
 Spelter, 6 1/2 cents per lb.  
 Lead, 3.75 cents per lb.  
 Antimony, 8 1/2 to 9 1/4 cents per lb.  
 Tin, 33 1/2 cents per lb. (Very strong and active.) We look for higher prices.  
 Copper, casting, 14 cents per lb.  
 Electrolytic, 14 cents per lb.  
 Ingot brass, 9 to 12 cents per lb.  
 Dec. 8.—Pig Iron. (Quotations from Drummond McCall Co.)  
 Summerlee, No. 1, \$24.00 (f.o.b. Toronto).  
 Summerlee, No. 2, \$23.50 (f.o.b. Toronto).  
 Midland, No. 1, \$21.00 (f.o.b. furnace).  
 Coal, Anthracite, \$5.50 to \$6.75.  
 Coal, Bituminous, \$3.50 to \$4.50 for 1 1/4-lump.

### Coke.

Dec. 6.—Connellsville coke (f.o.b. ovens).  
 Furnace coke, prompt, \$2.80 to \$2.85 per ton.  
 Foundry coke, prompt, \$3.00 to \$3.25 per ton.  
 Dec. 6.—Tin (Straits), 31.90 cents.  
 Copper, prime Lake, 13.50 cents.  
 Electrolytic copper, 13.37 1/2 cents.  
 Copper wire, 15.25 cents.  
 Lead, 4.40 cents.  
 Spelter, 6.37 1/2 cents.  
 Sheet Zinc, 8.50 cents.  
 Antimony, Cookson's, 8.37 1/2 cents.  
 Aluminium, 23.00 to 24.00 cents.  
 Nickel, 40.00 to 49.00 cents.  
 Platinum, \$29.50 to \$33.25 per oz.  
 Bismuth, \$1.75 per lb.  
 Quicksilver, \$52.50 per 75-lb. flask.

# MINING BOOKS

## Dredging for Gold in California

by D'Arcy Weatherbe

220 pages, indexed, illustrated. \$4.00 postpaid

It is acknowledged by experts that modern dredging owes much to California, for in the Oroville and Yuba districts the successful extraction of Gold has stimulated mechanical ingenuity.

California methods are being adopted elsewhere. In "Dredging for Gold in California," Mr. Weatherbe describes in detail the California practice. The book is well illustrated with diagrams, drawings and photographs and gives invaluable data on working costs.

## A Guide to Technical Writing

by T. A. Rickard

127 pages. Indexed. \$1.00 postpaid.

"This manual is intended to help those who wish to write clearly on technical subjects. Rules are useful, but the understanding of the reason on which the rule is based is better. No man can apply a rule until he understands when to disregard it."  
—From the Preface.

## The Metallurgy of the Common Metals

by L. S. Austin

Second Edition, entirely re-written and enlarged, illustrated, indexed.

500 pages \$4.00 postpaid

A simple comprehensive treatise on the metallurgy of gold, silver, copper, iron, lead, and zinc ores. Of all the numerous books on metallurgy this is the best for those desiring a general knowledge of all branches of the art. It will appeal particularly to the worker in one branch who wishes to know the essential facts about other sorts of ore reduction. It is a good text-book for universities and technical schools.

## Aaron's Assaying

by C. H. Aaron

Part I—Gold and Silver Ores. \$1.00 postpaid.

Part II and III—Gold and Silver Bullion, Lead, Copper, Tin, Mercury. \$1.50 postpaid.

A standard work in Assaying and thoroughly up to date. The result of years of experience and teaching by a competent assayer. These Books are technically accurate in their description of the most approved methods of assaying.

## Hints on Amalgamation

by W. J. Adams

Third Edition, Revised and Enlarged. Pocket Size. Flexible Leather Cover.

120 pages. \$2.00 postpaid.

A book in which the experienced amalgamator will find many valuable 'hints' and that will enable the novice to learn correct methods of current practice. If every mill-man would thoroughly assimilate the contents of this little volume it would keep him from making many costly 'breaks'.

## Through the Yukon and Alaska

by T. A. Rickard

Beautifully illustrated with over 175 half-tone cuts and maps.

408 pages. Indexed. \$2.50 postpaid.

This book is an account of a journey through the Yukon Territory and the District of Alaska during the summer of 1908, and is a non-technical description of a region of great technical interest. The scenery, people, and industries of the north are described by a traveler trained to observe and write in an interesting manner.

## Recent Cyanide Practice

by T. A. Rickard

350 pages. Indexed, illustrated. \$2.00 postpaid

A compilation of the best and most trustworthy articles on the subject by authors that are leaders of this particular branch of metallurgy. Describing in detail the latest improved machinery and devices, and giving invaluable data concerning working costs.

## Fire Assay

by L. S. Austin

88 pages. \$1.00 postpaid.

There are many books on Assaying, but none are better calculated to serve as a ready reference for the assayer seeking the more commonly recognized methods for the determination of Gold, Silver and Lead in Ores and Metallurgical Products as Prof. L. S. Austin's Fire Assay.

## Journeys of Observation

by T. A. Rickard

Handsomely Illustrated. On Heavy Coated Paper.

500 pages. Author's Edition \$5.00 Cloth \$3.50

This book contains the observations made by a traveler who happened to be a mining engineer with the facility to write in a lucid and entertaining manner. The descriptions relate to two of the most interesting mining regions, namely, Colorado and Mexico. In both cases the local coloring, the picturesque element, the geological structure, and the industrial conditions, are all interwoven into a fascinating account of mining development and metallurgical progress.

BOOK

DEPARTMENT

**Canadian Mining Journal**  
Confederation Life Building, Toronto

When answering Advertisements please mention THE CANADIAN MINING JOURNAL

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## ENGINEERS, METALLURGISTS AND GEOLOGISTS

|                                                                                                                                                                                 |                                                                                                                                                |                                                                                                  |                                                                                                                  |

## A CROWN MINERAL PROPERTY

Suppose the Government should say to you there is a property worth \$10,000. We will sell it to you for \$10,000, payable in 20 annual instalments and won't charge interest on deferred payments. In event of your death at any time during the 20 years, we guarantee to cancel the balance due and execute a warranty deed to your wife, or if she prefers, we will pay her \$10,000 in cash. If you live to complete all payments, we will pay you \$10,000 cash, plus interest earned on your annual deposits. Chances are you would jump at it. We are making just such an offer backed by assets of over \$45,000,000. Better investigate it.

# **GEOLOGICAL SURVEY**

## **PUBLICATIONS**

The Geological Survey has published maps and reports dealing with a large part of Canada, and with many local areas and special subjects.

**MARITIME PROVINCES**

The whole of Cape Breton, and a large portion of the coal and gold fields of Nova Scotia, have been reported upon, and mapped on a scale of 1 mile to 1 inch. The remaining portions of the Province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter Provinces, mapped on a scale of 4 miles to 1 inch.

**QUEBEC**

Quebec, south of the St. Lawrence, has been reported upon, and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the Province north of the St. Lawrence are also available.

**ONTARIO**

A large part of the Province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

**THE PRAIRIE PROVINCES**

Geological maps and reports have been issued covering the greater part of the Provinces of Manitoba, Saskatchewan, and Alberta.

**BRITISH COLUMBIA**

The southern portions of British Columbia, as well as other parts of the Province, have been reported upon and mapped.

**YUKON**

Many of the important areas in the Yukon have been reported upon and mapped.

**THE NORTH WEST TERRITORIES**

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost, and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

*Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

**THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:****CANADA**

1084. General Geological Map of Canada. Scale 100 miles to 1 inch.

**NOVA SCOTIA**

1019. City of Halifax Sheet.  
1025. Waverley Sheet.  
1037. Windsor Sheet.

The above sheets belong to the regular series of Nova Scotia map sheets on a scale of 1 mile to 1 inch. The first includes Halifax City and Harbour, the second the Waverley Gold District, and the third Gypsum Quarries.

**ONTARIO**

1023. Geological Map showing position of Corundum-bearing rocks in Central Ontario.  
1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

980. Portion of Algoma and Thunder Bay districts, Ontario, 1908. W. J. Wilson.  
1081. Region lying north of Lake Superior between the Pic and Nepigon Rivers, Ontario, 1906. W. H. Collins.

**BRITISH COLUMBIA**

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shows the geology and location of veins.

1004. Geological Sheet, Rossland Mining Camp. Scale 1200 feet to 1 inch.  
1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch.

**YUKON**

1041. Geological and Topographical Map of Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of same belt.

NOTE.—Maps recently published may be had on linen cloth, for use in the field, at 10c. per copy.

**REPORTS**

1072. Summary Report of the operations of the Geological Survey for year 1908.  
1085. Descriptive Sketch of the Geology, and Economic Minerals of Canada. G. A. Young. Introduction, R. W. Brock.  
1075. Gowganda Mining Division, 1908. W. H. Collins.  
1035. Coal Fields of Manitoba, Saskatchewan, Alberta, and Eastern British Columbia, 1908. D. B. Dowling.  
1050. Whitehorse Copper Belt, Yukon. R. G. McConnell.

**NEW CATALOGUE**

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

# Ontario's Mining Lands

---

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are : Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc ; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows :

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

**Miners' Certificates** good for a calendar year may be obtained by sending \$10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of \$10.00 plus a yearly rental of \$1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed

territory may be purchased as a mining concession at the price of \$20.00 per acre if within 20 miles of a railway in a straight line, or \$10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

**The Hon. Minister of Colonization, Mines and Fisheries**  
Quebec.

**D. W. CLARK, P.O., Box 521, Toronto.**

# The Longest Continuous Double Track Railway in the World Under One Management.

## The Great Double Track Route Through Canada.

Fast passenger service from the Atlantic Ocean to the head of the Great Lakes. The line taps all the principal commercial centres in Canada and reaches the important points in the States of Maine, New Hampshire and Vermont, the principal towns and cities in the Provinces of Quebec and Ontario, and many important places in the States of Michigan, Indiana and Illinois.

## The "International Limited" (Canada's Railway Greyhound)

### The Finest and Fastest Train in the Dominion

Runs every day in the year leaving Montreal at 9.00 o'clock in the morning for Toronto, Hamilton, Niagara Falls, Buffalo, Detroit, Chicago and intermediate points.

Write for copy of "Trains 3 and 4" descriptive of the route from Chicago to the sea, to J. Quinlan, Bonaventure Station, Montreal, or to J. D. McDonald, Union Station, Toronto.

# MONTREAL STEEL WORKS, LIMITED,

P.O. BOX  
2369 Montreal

Manufacturers of

**Steel Castings**

(Acid Open Hearth System)

**Switches and Track Work**

for Steam and Electric Roads

**Springs**

of all kinds

**Manganese Steel Castings**

for wearing Parts, insuring Great  
Hardness and Durability

**INTERLOCKING PLANTS  
TRUCKS FOR ELECTRIC CARS**

AGENTS FOR CANADA FOR

**THOS. FIRTH & SONS, LIMITED, SHEFFIELD, ENGLAND**

"Speedicut" High Speed Steel, Tool Steel, Axe Steel, Saw Steel, Files, etc. A large stock carried in our warehouse

**BARROW HAEMATITE STEEL CO., BARROW-IN-FURNESS, ENGLAND**

Quotations for Tee Rails, Fish Plates, etc., promptly furnished.

Catalogues sent on application.

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

**General Passenger Department, Intercolonial Railway**  
**MONCTON, N.B.**

# Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

## Canadian Westinghouse Co., Limited

General Office and Works, HAMILTON, ONTARIO.

Traders Bank Bldg.,  
TORONTO.  
439 Pender Street,  
VANCOUVER.

Address nearest office:  
HAMILTON.  
922-923 Union Bank Bldg.,  
WINNIPEG.

252 St. James Street,  
MONTREAL.  
158 Granville Street,  
HALIFAX.

# HAMILTON POWDER COMPANY

Head Office: 4 Hospital Street, Montreal  
MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and  
Sporting Powder, etc.  
Safety Fuse, Electrical Fuses, Batteries, and other  
Accessories.

### NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

### "WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It **does not freeze**, or rather, explodes with perfect efficiency when frozen and needs no thawing.

### "AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

### PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

COBALT      TORONTO      KENORA      WINNIPEG, MAN.  
VICTORIA, B.C. VANCOUVER, B.C. CALGARY, ALTA. NELSON, B.C.

Three Post Magneto Electric Blasting Machine
